PUBLISHER'S NOTE:

This publication is designed to provide an easy and accessible method for playing the 'touch-style' or 'two-handed tapping' method on amplified electric fretted instruments such as guitar or bass or the 'megatar' type instruments which have two groups of strings on one fretboard. This method is designed specifically for instruments which have eight or more strings, and can only be adapted to instruments with lesser numbers of strings by means of diligent effort on the part of the student. This method is provided 'as-is' and is believed to be a reliable method providing musical results in typical musicians, and providing comparatively rapid advancement in mastering useful and musical technique. However, the best results will probably be attained when this material is delivered in combination with personalized and professional instruction. Mobius Megatar and associated music dealers assume no liability for whatever results or lack of results as are obtained by the student. We urge the student wherever possible to seek the assistance of competent music instructors.

Except in the United States of America, this book is sold subject to the condition that it shall not, by way of trade or otherwise, be lent, re-sold, hired out, or otherwise circulated without the publisher's prior consent in any form of binding or cover other than that in which it published and without a similar condition including this condition being imposed on the subsequent purchaser.

The MISSION of the Easy Touch-Style Method

1. To present a **simple and powerful** music-learning **method** for the guitar technique known as “two-handed tapping” or “touch-style”

2. To create **rapid learning** by

- A) focusing on the most useful building blocks
- B) operating in harmony with the way a human operates
- C) permitting identical and simultaneous hand-training
- D) providing a cross-instrument method that works in several common tunings

3. To **enable extension** by providing hooks from the basic method toward wider techniques

* Books 1-3 teach you how to quickly begin playing music. Book 4 presents the full, unifying “Eight-Folding Path”.

The TARGETS of the Easy Touch-Style Method

If you reasonably study and practice the Easy Touch-Style Method, as given in the method books published by Mobius Megatar, Ltd, you will soon accomplish these targets —

You will be able to perform music using the basic techniques of the “Eight-Folding Path*”, which include

- Playing bass rhythms, and walking bass
- Playing left-hand chords
- Reading and playing melodies in the melody or bass strings or in both simultaneously
- Improvising freely and easily over chord changes
- Playing rhythmic right-hand chords over basslines
- All these can be done with the hands in one single position

You will be able to extend your technique in various directions, which include

- Playing two-handed chord arpeggiations and rhythms
- Playing extended right-hand chords
- Reading two-stave charts in standard notation (piano music)
- Moving around the fretboard with a simple location system (LongFinger)
- Writing Intros and Outros for songs
- Using simple chord substitutions to enrich harmony
- Playing rapid lines with a two-handed linear system along the fretboard

Dedication

October 13, 1933

Nicola Tesla — Born Croatia 1856, Died 1943 in the United States, Studied physics and math at Graz Polytechnic, and philosophy at University of Prague. Worked as an electrical engineer in Hungary, France, and Germany. In 1888 his discovery that a magnetic field could be made to rotate using coils in a new way made possible the development of the AC (alternating current) induction motor, a device using no brushes which was previously considered impossible. This device made the universal transmission of electricity possible.

Tesla had emigrated to the United States in 1884, initially working for Thomas Edison, and later becoming a rival. Edison advocated DC (direct current) transmission of electricity, which didn't work very well. After heated competition, Tesla was commissioned to design the AC generators installed at Niagara Falls. George Westinghouse purchased the patents to Tesla's induction motor, and made them the basis for the Westinghouse power system, which still underlies the modern electrical power system on our planet.

Tesla did early research on wireless communication, and devised systems which anticipated radio, fax machines, radar, radio-guided vehicles and aircraft. The inventor of the 'Tesla Coil', as well as sourceless illumination, and wireless transmission of power, which inventions have been lost.

But most importantly for us, he invented the machines which gave the world electricity. Electricity is the primary enabling technology which gives us our present world. And for us musicians, electricity makes possible amplifiers and electric guitars. And electric guitars make possible two-handed tapping on strings. So we honor Nicola Tesla. He gave us our world.

Acknowledgements

Author Henri DuPont wishes to say ...

It is very simple. I thank the Professor Beauchamp for encouragement of the ragamuffin downstairs, and I thank Madame Dun for her tender courtesies.

The Sorbonne was entirely right to throw me out, and I apologize to Rene and all the gentle people at Le Monde. Even the dire predictions of Fr. Dain, when my mother escaped to Zaire, were not far off. It seems that you were right after all. I can blame only the wine, and my impatient nature.

I thank Josef in Sao Paulo, who taught me the true Tumbao as it was of old.

I thank Eric Satie. Mr. Satie, as perhaps is well known, had a great early success and it convinced him that he should study music. And afterwards he lamented that, knowing too much, he could no longer write the simple compositions so captivating as in his youth and his ignorance.

I pray God that we may all remain ignorant and creative, in the midst of our learning.

Author Traktor Topaz wishes to say ...

When you hear a man describing himself as a 'self-made' man, you're listening to a guy who's forgotten all the people who have helped him along the way. The same could be said for this book and the 'Bookmark System' which it presents, and the same could be said for the musical instrument designed and marketed by our company, Mobius Megatar.

I am grateful to Roy Lee Brooks, the band teacher in Henrietta, Texas, who encouraged me to take up rudimental snare drum in 1955. I am grateful for band leader Howard Raeke, who insisted that even the drum section study the music theory book. I thank Emmory Whipple, rudimental champ, for the experience of sustained practice, so that one day I realized that my hands knew the way, and like a recording engineer in a control booth, I was somehow removed, just listening and adjusting.

I'm grateful to Peter Paul and Mary for making me want to learn guitar to torment my fellows with folk songs, grateful to John Hill for selling me his Stratocaster, grateful to Howling Wolf and Little Walter, grateful to Dave Feldman, who taught me 'Blues Harmonica for the Musical Idiot' from xeroxed sheets at 'Chickens That Sing Music' music store in San Francisco's Haight Ashbury.

I'm grateful to the third West Coast Computer Faire in Moscone Center, where I heard my first synthesizer, which drew me across the floor in search of the sound. I'm grateful to Bernie Krause, who sold me my first synthesizer, and to that fellow who made the first tapping instrument I ever tried. I'm grateful to Frank Jolliffe, my mentor and friend, who taught me how to play, and to Sheet Music Magazine (Easy Piano Version) for reading material, and to theory guru Jim Grantham who made guide tones and folded chords abundantly clear.

I also must acknowledge learning how to study (and thus how to teach) from the Scientology 'study materials,' and I must thank Bandler and Grinder and Milton Ericson for insights of how the mind works to grasp the world. Even my university training (psychology and engineering) has been helpful!

I thank Adrienne Gallant, for support, tolerance, and love.

This book contains bits of rudimental snare-drumming from Henrietta Texas, bits of the blues, bits of my teachers and instructors and fellow students, and bits of my studies of the mind. Without these people and these diverse learnings, the amalgam and synthesis which is the Bookmark System could not have been conceived nor written.

Thank you all.

Preface

Many years ago, Traktor Topaz appeared in a jazz band class which I was teaching. He was carrying a touch-style instrument and announced that he wanted to be the bass player. I had never seen such an instrument and so had my doubts, but I welcomed him to the class and he did a great job as bass player. We ended up featuring him on one song where he played bass and melody at the same time. This was my introduction to touch-style instruments.

I am very proud of my former student who has become a fine musician, inventor, and teacher himself.

This book, Easy Touch-Style Basics, gives a great introduction to touch-style playing. Bass players learning touch-style can especially benefit from this instruction because of the way that scales and chords are mapped out on the fingerboard. In a very clear fashion, the authors give a basic introduction to playing melodies (based on scales) and harmony (based on chords). I'm already looking forward to volume II of this method.

The idea of teaching both hands to do the same thing helps the student learn the exercises quickly, and learning chords as part of progressions gives immediate practical use to the material in this book.

The method of showing a group of chords which can be played in one position is very logical and helps the student avoid losing his or her place on a many-stringed and many-fretted instrument. This is a more pianistic approach than most other stringed-instrument methods, which makes the theory and harmony lessons very clear and accessible to students of any level.

People playing touch-style instruments may come from a background of playing the bass, playing the guitar, playing some other instrument, or be completely new to music. This book will be perfectly clear and accessible to anyone from any of these categories.

I wish all prospective touch-style players well on their adventure. In addition, I think that those of you who have purchased a Mobius Megatar touch-style bass will find that you have in your hands an ideal instrument to apply these lessons.

Jeremy Cohen
Berkeley, CA
September, 2000

Jeremy Cohen is a professional bassist with over 35 years experience in all types of music, and a nationally-known bass instructor. Co-founder of the band Jazz Express, he composed half of the songs on its debut album. His performances around the San Francisco Bay Area include the musical "Beach Blanket Babylon", the bands City Lights and Adama, and The S.F. 49ers Big Band. He has taught at the National Guitar Summer Workshop, and since 1982 has been a staff-member at The Blue Bear School of American Music in San Francisco, giving clinics, and teaching classes in bass, music theory, composition, and jazz combo. Former students include Matt Freeman of Rancid and Arion Salazar of Third Eye Blind. Mr. Cohen can be contacted through his website at

Introduction

It's a Problem!

It's a daunting task — to produce a Method Book which is simultaneously useful for new musicians who never held an instrument before and for experienced veterans who can calculate advanced theory in a flash and play the result in real-time studio gigs.

Even though our material is relatively simple, and our goals modest, the core problem is — how to go slow enough and give enough information so the beginner can be rewarded with musical progress, and yet at the same time provide the information concisely for the experienced professional who just wants to get it and go with it.

The problem of “slow enough” versus “concise enough” is compounded by the fact that there are numerous tunings currently in use among touch-style enthusiasts, and there is much to be said for many of these tunings.

There are, in addition, several valid methods of touch-style currently being taught and shared by skillful touch-style teachers. For example, there are valid systems which initially teach the student to move shapes (chords and scales) around the fretboard and other valid systems which teach shapes in one particular position.

There are across-the-string scales, and along-the-string scales, and there are diagonal across-and-along-the-strings scales! And for each of these approaches, coherent and thoughtful players and instructors can be found.

There also exist among skillful touch-style musicians and among guitar- and bass-playing musicians several differences of opinion as to whether it's better learning to use three fingers or four fingers to play scales and chords. Both points of view have logic, good results, and outstanding musicians espousing the position. Some use four fingers on the bass strings, and three fingers on the melody strings, and with well-presented reasons for the approach.

Then there are the students' skills.

Some students can sight-read two clefs in real-time on touch-style instruments. Other musicians of skill, perhaps world-class and studio-caliber, just have skillful ears and can't read standard notation at all. Other students can hum a tune, and once saw a guitar. That's what they come in with, but they want to learn to play and we want to help make it possible.

Reducing Confusion

All humans fall prey to the mental cloud which we call 'being confused.'

What this really means is mentally stumbling around with a lack of clarity and unable to grasp the problem or even to see the problem clearly.

The experience of confusion seems to be inevitably caused by the human attempting to grasp more things at once than the human *can* grasp.

For example, in a tornado, with large and small objects flying through the air so fast you can't keep track, it is hard to know which way to go.

In a similar way, a human approaching a new field often attempts to grasp a large number of new ideas simultaneously. Now a child wouldn't normally make that mistake because the child comes into the situation with one tenet already firmly held in mind. That is, the child comes in knowing that “he doesn't know.” He has no expectation for knowing, and so may experience less discomfort. Adults, especially competent adults, are far more likely to think that they ‘should’ know, especially if they have been exposed to the material in the past.

In this comparison, the child has an emotional advantage, because the child already has One Stable Datum. That is to say, the child has one thing he knows for certain, and all the new stuff can be organized around this one core fact.

If the adult can in fact start with One Stable Datum, the adult can achieve a clarity and lack of confusion as well. For example, if you already read music, you know about the names of notes (A-G) along with their sharps and flats, and you can fit in the new stuff about where these (known) notes fit on a fretboard with your (already known) Stable Data. This can make clear sense of the new stuff without being confusing.

But if the adult comes in without any previous knowledge, then it is up to the presenter to provide a sequence of graspable ideas, each of which is clearly presented, and which can build upon each other so as to grow into the whole of the knowledge which we wish to impart.

Of course, if the adult comes in with previous *confusions* then the presenter must be even more careful about the sequence and clarity of material being presented. Because a human viewing *through* a confusion at a new subject is peering through a glass, darkly.

How Will We Present Simply?

So what's our big plan to reduce confusion?

Since we wish to reduce confusion for ourselves and for the student, we will first attempt to reduce the number of elements, and then to present slowly and carefully this (relatively) small number of elements.

So what, for example, can we eliminate?

We think we can in general avoid recreating a general music-theory book. Many great theory books already exist, and the information in that subject is vast. Further, many people can play rather well without a lot of theory so we know that lack of lots of theory is not a deadly barrier to learning two-handed touch-style technique.

How will we avoid theory?

Of course, we just cannot completely avoid theory. But we can minimize some of it, as it were presenting selected information carefully so as to side-step having to go off on a theory tangent in order to make sense of the tapping instructions.

Next, we can weave in small doses of necessary theory as we go along, and this will allow us to defer some theory into later books as we expand the subject. The authors have observed that theory by itself is deadly dull to many folks. Only when you can see that theory helps you *play something* does theory get interesting to many of us.

Next, at the expense of annoying the pro musicians who are just studying this book to add a new technique to their existing armory, we'll explain things rather slowly and carefully, with many steps. However, the pros will appreciate that the actual system being transmitted (the 'Bookmark System' which uses a Master Exercise to rapidly obtain musical results) does actually compress into a few graphs and tables, so once you know the meaning of these graphs and tables, a very few pages can express the Master Exercise.

This 'go slow' approach is made more tedious (for authors and students alike) by having to explain the *exact same thing* several times over to allow for folks that have their instruments tuned differently.

So to strike a reasonable balance, we'll cover the three tunings which seem to be most popular and (in our opinion) functional. Many other very interesting tunings exist, but the student advocate of one of these tunings should with diligence be able to translate one of the three we provide into almost any tuning.

Further, we won't repeat the material three

times in cases where it seems that presenting it once for one instrument will suffice, and that players of the other instruments can adapt the material on the fly as obvious.

We will almost certainly fail to present material slow enough for some, or quick enough for others. It will be too much theory for some, and not enough for others. This just shows the wonder that is the human race, and the failings of the individual human writer. We've tried our best to present the system so that you can grasp it rapidly and with musical results.

We think the touch-style method of play (either using our system or some other system) is just wonderful. We hope that you come to love it, too.

The Purpose of This Book

We think two-handed touch-style should be better known and enjoyed.

It permits your two hands to play simultaneously, much as can a musician on piano. You can play left-hand chords while playing a melody. Or you can make up a melody with a bassline beneath it. You can read and play Bach Two-Part Inventions. You can play boogie bass with simultaneous rhythmic rock chords.

Will you learn all of that in this book?

No, our goals here are a bit more modest.

By the end of this book, you will be able to play your 8-String Bass (or Megatar or other tapping instrument) by means of bass roots or arpeggiating chords in the bass.

You will also be able to arpeggiate chords in the right hand, or more importantly, you will be able to play very simple chords in a rhythmic manner on top of your bassline.

You *will* have the *basis* for all the above technique, having learned it in a simple and clear system which will enable you to play several touch-style instruments using different tunings.

You'll make rapid progress, and you'll have fun, and what you learn permits you to create musical results from simple elements.

The purpose of this book is to give you a rapid and competent introduction to two-handed touch-style technique so that you can play what we call 'Rhythm Bass' and at the same time give you the groundwork for lots more.

Please Share

We have enjoyed the voyage of creating this book. We hope you enjoy the voyage that is two-handed touch-style.

Music is meant to be shared. If you love what

How to Learn

Principles of Learning

Most of us crawl from the cradle in a state of rapid learning, so perhaps it's not so odd that we rarely think about 'methods' or 'principles' of learning. Especially during our formative years, we are as immersed in learning as fish are immersed in water.

But the fact is that our early learning is somewhat innate, and somewhat 'monkey see, monkey do' modeling of the other humans around us, and learning a subject such as musical technique is neither innate nor easily copied merely by watching other musicians.

As proof of this statement, we ask you to recall to mind what teenage boys seem to learn from musicians seen on MTV. What do they learn? Hairdos, attitudes, ways of talking and posture and hand gestures. Actual musical skills? Not a lot.

Also, you have probably noticed that some people are better at learning things than other people. Some of that is genetics or aptitude. But some of it is because different people approach learning differently.

In fact, there do exist certain principles of learning. If you follow them you can make more rapid progress than otherwise. Some you may already follow. Others would advantage you greatly to adopt.

Step by Step

Learning occurs in little bursts, with some loss between learning sessions, and a residual accumulation of learning which we then call 'skill.'

Therefore, learning best occurs in a step by step fashion. You just cannot grasp a whole lot at a time (and retain it in any useful fashion). You cannot learn a little and go away for a long time and then come back and learn a little and go away, etc. Because you won't advance.

So if you wish to learn, step one is to COMMIT to regular and ongoing frequent learning steps. In music we normally call this 'practicing.'

If by any chance you are one of those who have in the past been burned (damaged/upset) by the practice of 'practicing,' please realize that done correctly it will neither bore you nor make you feel inept nor uncomfortable. In fact, done in little regular steps, you should feel interested and pleased in that every few days you can see signifi-

cant progress. That is, every few days you can play something new.

So step one is to COMMIT to regular and frequent practice. It is better to practice 30-45 minutes every single morning than to practice 6 hours every Sunday. You will learn more.

Find your time that you can actually get yourself to the instrument every single day, and stick to it, and as certain as the sun rises, you will be able to play music. It's just a fact —

If you persist, you'll win.

The Proper Gradient

If you try too much too fast, you'll flop. The way that feels is that your head is spinning, the stuff doesn't make much sense, it's hard to do and you don't like it much, either.

If you try too little, it's slow and tedious and little progress is observed. The way that feels is that, yeah yeah yeah, you've heard it already, and you probably have to force yourself go to practice because it's boring you out of your mind.

The correct gradient gives you some new challenge at least every few days, so you have to ask yourself, 'Can I do that?' And you think maybe you can, but you're not quite sure. On the other hand the correct gradient in practice means that 85 to 95 percent of the notes you play are correct with good tone. You don't ever have to wallow in a misery of missed notes or sloop around with a bunch of bad-sounding stuff.

Very slightly challenged, and feeling generally confident is how the correct gradient feels.

You can use the feeling as one guideline to attaining the correct gradient — If you feel daunted or overwhelmed or buried in errors, then simplify and slow down. If you feel like it's easy, push it so you have to pay close attention to avoid errors.

One of the greatest gifts which a more experienced musician or teacher can impart is to help you set the proper gradient. If he sees you're buried, he can help you simplify and slow down. If he sees you need more challenge, there's always something more to learn.

Clarity Regarding Words

The concept of confusion is not well understood in our culture. Confusion is not something that is done to us. Confusion is the feeling that accompanies operating our mind in a particularly ineffec-

tive manner. The basic error is to try to grasp more things at one time that is possible for you. For example, imagine a tornado throwing large and small objects around you faster than you can track — in which direction does safety lie?

The solution to confusion is to reduce the elements, and especially effective is to find *one* major element to track. For example, in that tornado, if you notice that one of the flying things is a large truck, you might concentrate on that one, and then you'd have a clue about which way to go. (True, you might be killed by a flying cow or refrigerator, but you wouldn't feel confused!)

As this applies to learning, one of the deadliest problems of the study of any subject is to fail to grasp the basic words or vocabulary of the subject. For example, suppose you decided to study dogs, and you read a book, and the book warns you to be cautious about the dog's muzzle. Now if you didn't know the meaning of this word, or if you thought it meant something different, such as a part of a rifle, it would be very hard to make sense of that sentence about being cautious about the dog's muzzle! You might think, "Sure I'll be cautious if the dog's carrying a rifle!" but you would feel puzzled.

Some people, if they noticed the puzzlement, would go and find out what that word meant, by using a dictionary or asking somebody. But what about those times when you don't even realize you've become puzzled? Or what about the times you're aware of being puzzled, but you think maybe by reading further it will become clear?

What then happens is that the entire chapter is puzzling, kind of vague and confused. It doesn't become clear at all. If you had a test on that chapter you'd fail.

And after a few chapters like this, the entire subject is vague and confused, and further you don't remember why you started this subject because it's not much fun and you don't even like it!

A few little words? Causing all that mischief?

You bet! Without the key words, then sentences don't quite make sense. Without the sentences, the core ideas and thus the pages don't make sense, and then the chapters don't make sense, and then there are two many things to track, and it's a confusion.

People leave subjects. They leave subjects due to vague and undefined words which they didn't trouble to clarify.

Clarify the words as you go. Make sure you don't go past puzzles. You'll find yourself retaining and understanding material better and easier than ever before.

As you go along, whenever you notice the *feeling* of vagueness, stop! You just went past an undefined word! Find it. It is located at the end of

the last part you understood clearly. Then once you've located it, mark it with a pencil and find out what it means.

Doesn't this take more time?

You mean, doesn't it take more time to actually learn the subject than to scan over the subject and then give it up?

Yes, it does take more time.

But then you actually learn the subject, and that was the actual intent, was it not?

Fingers versus 'Thinking About'

A very wise man once said that if you want to learn about tractors, don't try to memorize a thick book about tractors, but instead go get a tractor and try everything out one step at a time.

Music is like that.

True musical learning is about 90% Fingers and Ears, and at most 10% Mind.

If you just try to read this book about how to play, at the end you will not be able to play.

On the other hand, if you correctly use this book as a step-by-step road map, and you actually drive down the road, then you will arrive at the destination! That is, if you'll read a page for a few minutes, and then use your fingers and ears on the instrument for a few hours, you will have actually learned something. You will be able to play.

Learning to play is mostly Fingers and Ears. A good map, like a good teacher, is valuable because they can point the correct direction.

But nearly all of the actual learning occurs in your Fingers and Ears, and only a little bit in your Mind.

Rule-O-Thumb System

This book uses an approach we call 'Rule-O-Thumb.' Most of you know that this means it's pragmatic, based upon what generally works.

That's a good approach because it can be clear and simple, and the process of learning benefits from being clear and simple.

On the other hand, be aware that Rule-O-Thumb is sometimes not totally complete, and the Rule-O-Thumb does not try to encompass everything. That approach is called the Encyclopedia approach, and while it's great for reference books, it's really hard for an actual human to learn 'how-to' from an encyclopedia.

We specifically mention this shortcoming of the Rule-O-Thumb approach because in this book you might read one of our guidelines, and immediately you might think of an exception!

If so, please ask yourself whether the guideline presented is *generally* true. If it's generally true,

then you can use this rule to learn. If you are already advanced enough to foresee the exceptions, then you're just ahead of the game.

We have intentionally taken a Rule-O-Thumb approach because guys use this approach all the time when showing someone how to do something, and it generally works pretty well.

Most-Direct-Path System

Do you remember in the story about Sleeping Beauty, about how the prince had to find his torturous way through all the thorns to find the entrance and get some Sleeping Beauty action?

If you were that Prince, wouldn't it be great if there had been a handy 'learning gnome' outside the forest of thorns who would take you around to the correct side and point out the shortest way to get through the thorns?

Wouldn't that be great if you were learning how to play some music and somebody could show you the shortest distance, involving the minimum set of things that would give you the understanding and the fingers to play?

While we cannot with certainty claim to be exactly as wise as that learning gnome, we've tried our best to do just that.

While we're not entirely certain to have found the absolute shortest and most direct route, we do feel certain that we have found *a* direct route, and we've tried to make it both complete and concise.

Rabbit versus Turtle

In a great book called 'Zen Mind, Beginner's Mind,' Suzuki Roshi discusses a kind of parable about the 'Poor Horse.'

He says, in brief, that when you ride the best horse you just think about racing and lean forward, and the horse takes off like a shot.

But, he says, if you're riding an average horse you may need to shout commands and even tap the horse with your quirt to get him to run fast.

And then, he says, if you're riding the poor horse, you may have to strike him repeatedly with the quirt, so that he feels it in his bones, to get him to put out the effort and run.

Then he asks the question: Which horse would you prefer to be?

Suzuki Roshi says that most people who hear the story think that they'd like to be the best horse, or (if they're more humble) at least the average horse. But generally nobody wants to be the poor horse.

However, we would have to agree with Suzuki when he says that *it's not bad to be the poor*

horse. For one thing, it might just be where you are starting out, and you have *got* to start from where you are to make any progress because nothing else works.

Secondly, the poor horse actually can improve the most. A world-class pianist might have to work a year to increase his skill 1 percent. The beginning pianist probably increases his skill by more than 100% in that same year.

So, if something is clumsy for you, don't worry if you feel like the poor horse. That's an OK horse to be.

We also like the image of the Rabbit and the Turtle.

The actual fairy story calls them the 'Tortoise and the Hare,' but we're only slightly referring to that story. In the world of learning, there are indeed some students who are Rabbits and able to go rather quickly — they can learn the lesson in a short time and play music using it, they're interested in side trips and can go down side trips and come back in time to keep on the main journey.

Other students are by nature more like Turtles — they need to keep moving steadily on. They make steady progress because they just keep moving forward. They aren't as flashy, and they don't seem to be as quick learners, but they can get there all the same.

We think that either personality can succeed and learn to play music.

The main key to success is to recognize where you are. Are you a Rabbit? Are you a Turtle?

Either one is fine.

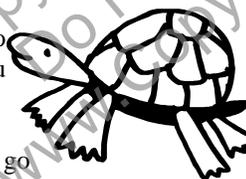

But if you're a Turtle, don't go darting down side lanes. Focused, steady progress is what will work for you.

And if you are truly a Rabbit, don't get scattered. Sure, run down the side lane and come back. On the main exercises, you don't need to beat it to death — when you know it and can play it, you've done that part and you can move on. But don't let your speed distract you. Always remember to come back to the main road, so that you actually arrive at the place you started for.

Divergence and Convergence

We have noticed a peculiar phenomenon that often occurs when you learn a new body of knowledge —

As you are new to the subject, it often seems that each new idea or technique is opening up another pathway, as if the information is creating pathways that are expanding and growing outward in new directions — that universe is expanding.

However, after a period of time, as you begin to have some grasp of the subject, you begin to notice that some of the new ideas or techniques seem to be *leading back* to something you already know. It's as if the new pathways are beginning to all come back together. That universe is beginning to lead back to some central area.

You could generalize and say that the beginner's new ideas diverge, and the experienced person's new ideas converge.

But of what practical use is this observation?

Just this — As you learn this new area, whenever you notice that some new concept or idea seems to *lead back* to an area that you already know, realize that you're moving into the 'experienced' classification.

It probably also means that, as you learn new material, if you will ponder the new material to see how it might connect with things you already know, it could pay dividends in your understanding.

Inchworm Technique

This is a specific technique that seems to be helpful when learning chord changes in either hand. Since we bass-players and 'rhythm-bass' players often play chord changes, the inchworm technique is handy to know.

As you'll discover, in this particular book the first chord 'progression' you encounter is just two chords. In fact, we call it an 'alternation' rather than a progression, because it doesn't much go anyplace.

However, from there on, you'll notice that chord progressions usually consist of three or more chords in a sequence that has a feeling of 'forward motion.' A song itself can be considered to be one long chord progression of many chords with some

sense of forward motion.

As you learn to move your hands and fingers from one chord to the next, you will sometimes discover that moving from one particular chord to some other particular chord often gives you a stumble. For example, perhaps you frequently stumble or hesitate when moving from G7 to CM7.

This stumbling at this particular spot can be a bit persistent as you practice. Because of course, with every stumble, you've practiced the stumble, and your body has a tendency to learn the stumble at just that spot.

Our general suggestion would be to slow down, and that's a good technique.

However, the 'inchworm technique' would be to stop and try playing the two chords *back and forth*. That is, although the chord progression probably does not have CM7 going to G7, the path between these two chords is the path between these two chords, and your fingers can learn the motion profitably in either direction.

So even though the chord progression only goes from G7 to CM7, you take a moment and show your fingers how to go back and forth.

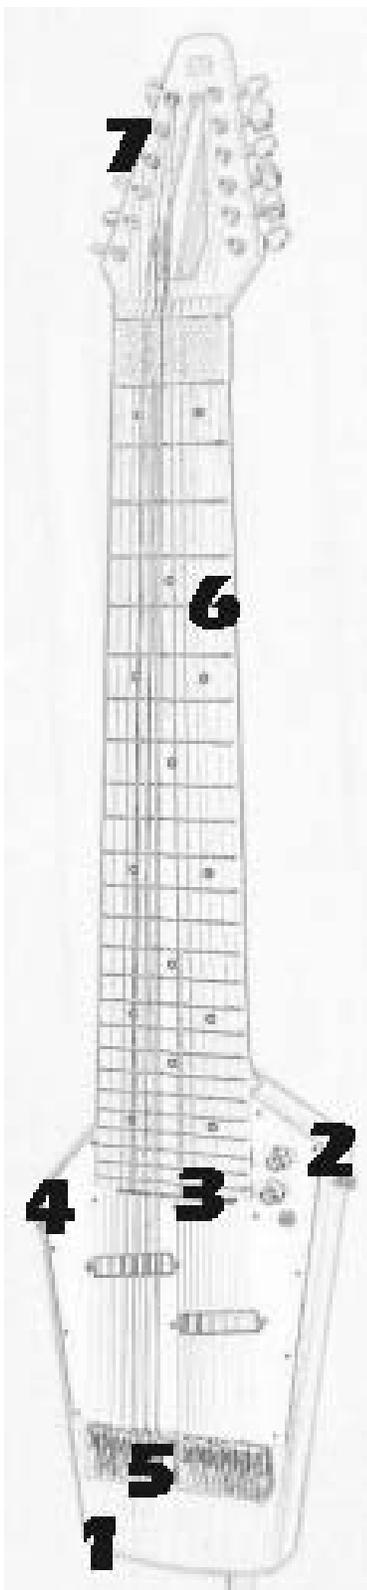

Since you've not learned any stumble in the 'reverse' direction, you will find that a few back-and-forths will tend to free your fingers from stumbling faster than just practicing the original direction.

We call it the inchworm technique because it's stopping the forward motion to go back and forth, kind of the way an inchworm moves forward.

When you think about it, it's just common sense. And we think your fingers will confirm the technique as useful.

As with all things musical, try it and see.

Introducing the Instrument

What Are These 'Touch-Style' Instruments?

Instruments which are especially made for two-handed touch-style play are often called by different names. Sometimes they're called basses and sometimes they're called guitars.

There is no commonly-agreed-upon term for these instruments especially made for two-handed tapping play.

The word 'megatar' was coined by our company, Mobius Megatar, as a generic term for an instrument especially made for two-handed touch-style play, and which has a set of strings for bass and another set of strings for melody.

Although our name 'Mobius Megatar' is our trademark for the specialty tapping basses which we manufacture, we have no objection to people using the single lower-case word 'megatar' as a generic term to refer to such specialty instruments. It's a pretty good word to describe such an instrument, as it comes from 'mega' (meaning 'a lot') and the word 'guitar', and because clearly such an instrument is *more* than a guitar!

Essential Points for a good Tapping Instrument

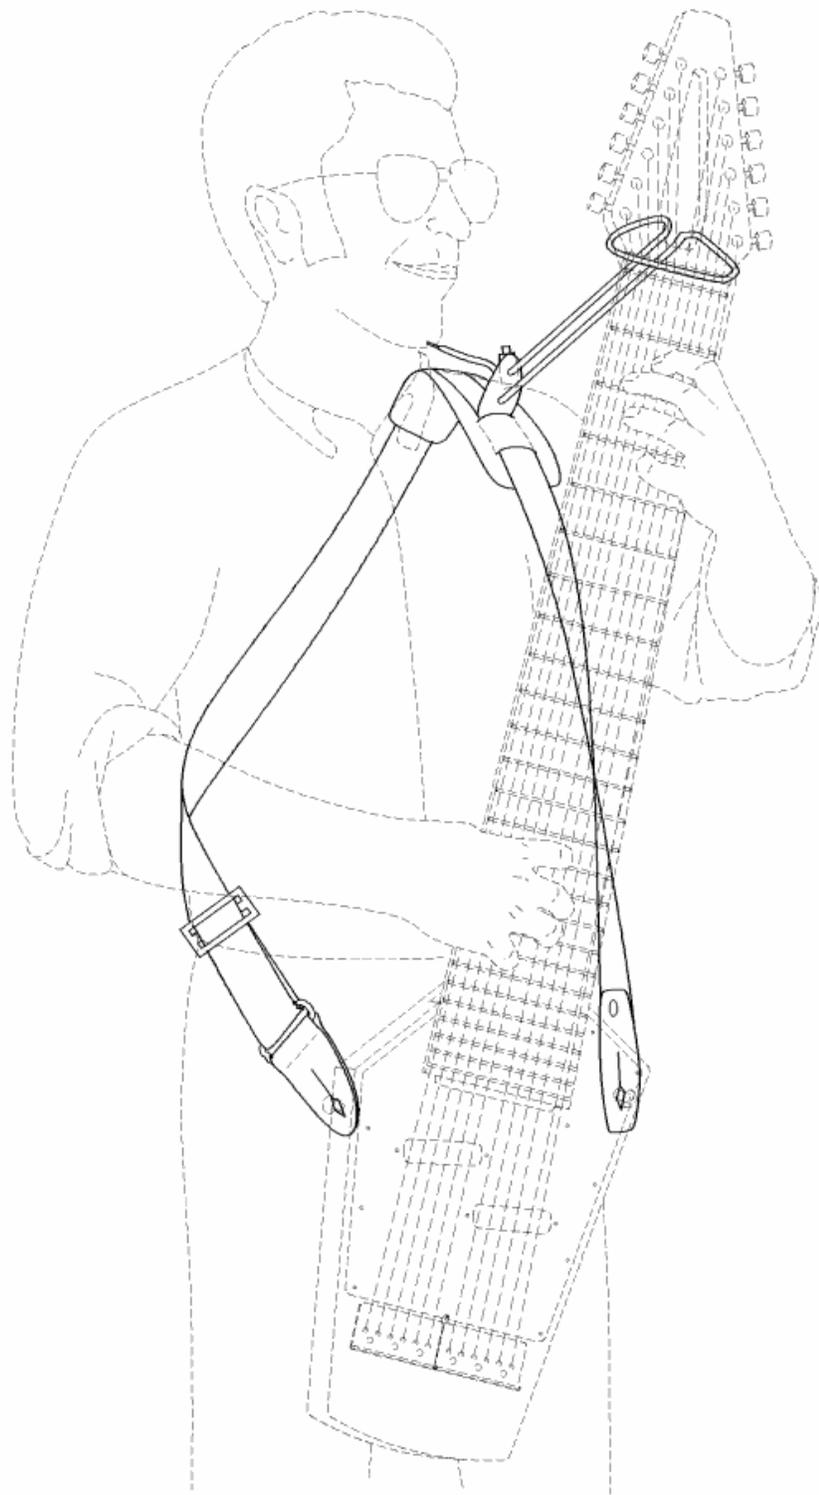

Whatever you may call your specialty tapping instrument, the key points are —

- It has a lot of strings so you can play very low and very high notes, just as can a piano player.
- It *may* have these strings separated into two groups so that each hand can move around the notes without stepping on the other hand's strings. But an 8-string bass can also serve as a great tapping instrument if properly 'set up.'
- To get a good sound from merely tapping with the fingertips, it must be 'set up' with a low and fluid string action, and usually it needs to have pickups adjusted rather close to the strings.

Pictured — the Mobius Megatar TrueTapper

The TrueTapper shown is a typical specialty tapping bass, with six bass strings and six melody strings.

1. Body — a streamlined design, keeps weight down.
2. Volume and Tone Controls — permits you to separately adjust the loudness and tone of the bass and the melody strings.
3. Dual Truss-Rod Adjusters — allows you to fine tune the fretboard to remain completely flat with the low action which produces the best sound and playability.
4. Pickup Assembly — as shown has one pickup for bass and one for melody, but this is a swappable option. Other pickup assemblies can have multiple pickups under the strings.
5. Fully-Adjustable Bridge — allows fine adjustment of string height, if needed.
6. Special Fret-Markings — similar to standard guitar, but slightly different, helps you relate notes under both hands.
7. Tuners — high-ratio for easy-on-the-fingers tune-up

Drawing shows specialty tapping instrument, supported by special strap in correct, upright position. This gives both hands easy access to strings as shown.

How do you Put It On?

When you purchased your tapping instrument, your manufacturer should have provided basic information about how to 'put on' the instrument so as to place it in a reasonable playing position.

Your instrument might be supported by a strap as shown, or it might be supported by a 'belt-hook' device which is affixed to the rear surface of the instrument and which you hook over your belt or your trousers so that your instrument is supported.

There also exist other support devices, including some which will support your instrument when you are playing seated.

The important thing is that you manage to get the instrument supported so that it is comfortable on your body for the duration of the performance, and that the instrument is in a nearly-vertical position as shown.

This vertical position allows both of your hands to 'get at' the strings in an easy manner with minimal bending of the wrists. This keeps your hands in a good playing position, while minimizing fatigue during performance.

Your left hand will be positioned somewhat as shown more or less near the tuners, as you normally play the lower end of the bass strings with your left hand.

Your right hand is normally positioned as shown closer to the instrument's body, as you'll commonly play right-hand melody or harmony notes 'higher up', meaning nearer to the body.

How do you Jack It In?

Somewhere near the volume and tone controls you should find a jack. Many of the specialty tapping instruments have a single 'stereo' jack which jacks into the instrument, and from this extend two separate cords, one carrying the signal from the bass pickups and the other carrying the melody pickups' signal.

This permits you to use different amplifiers or different 'channels' to effect your sound separately if desired.

Notation

What is Notation?

Notation means 'how musicians make written notes about which notes to play.' That is, notes made about notes played = Notation.

In this introductory book, we were able to avoid dealing with much notation. However, in later books, several types of notation will be used. We mention them now only as an introduction.

Standard Notation

'Standard Notation' means ordinary sheet music

Guitar Tab

'Guitar Tab' means 'Guitar Tablature' which consists of six lines which represent the guitar strings. On these lines are printed numbers which represent a fret number. So if on the first guitar string you see a '12' then you know we're talking about the note found at fret 12 of the first string.

By itself it doesn't tell you what finger to use, nor whether the note is an 'A' or an 'E', nor exactly when to play the note nor how long to hold it.

Guitar tab is often combined with standard notation. That is, you'll see the staves of standard notation (as shown above) and right below those staves you'll see some lines representing the strings of your guitar or bass.

In this combination, each type of notation brings its strength to the picture. The standard notation clearly lets you know what note is to be played, and when to play it, and how long to hold it. And the guitar tablature below indicates precisely on which string and at which fret to play this note.

In this way, an experienced player or teacher can notate exactly how he worked out the execution of notes that were specified in the standard notation. As you'd probably guess, this combina-

tion is most commonly seen in instructional material, as it takes up a lot of space. (If you're playing a song live from such 'music', you'll be turning pages a lot before the song is done.)

There is no information for us guitar and bass players about what finger to use, or which particular fret or which string to play Mr. Note upon.

So Standard Notation is real specific about what is to be accomplished, with no particular clues given about how to accomplish it!

Standard Notation looks like this —

tion is most commonly seen in instructional material, as it takes up a lot of space. (If you're playing a song live from such 'music', you'll be turning pages a lot before the song is done.)

We will come to guitar tab, as well as standard notation, in following books, but won't have to deal with it in the current book. We bring it up here merely for discussion.

String Graphs

In this book we will use a number of string graphs, which show the strings and frets along a certain section of the fretboard. Then on specific strings at specific frets we can put symbols which stand for our fingers, so that we can know just how to go about fingering the notes there.

There is no indication about when to play the notes nor how long to hold them. But for our learning note-names at certain fretboard positions, this will not be much of a problem as you will see.

Further, the String Graphs can be presented with the Note Names in position rather than the fingering charts, so that you can know which notes fall at a specific string and fret as shown on the Graph.

In fact, that's the way we'll start — by select-

ing a specific area of the fretboard, and then showing you a small number of notes which occur there, and then how to finger this small number of notes.

Everything else will then evolve from the original String Graphs, for the purpose of learning to play.

Traktor's Finger Symbols

Although some folks use the numbers '1', '2', '3', and '4' to indicate the fingers, we think there are already too many number references involved in musical discussions — for example, measures are referred to by numbers, most chords are referred to by numbers, notes in a scale are referred to by numbers, the musical distance between two notes (the 'interval') is referred to by numbers.

To avoid adding yet another set of numbers, we have chosen instead to use a simple set of geometric symbols. We didn't think this up. You can find lute music from the 14th century using circles and squares and other geometric symbols.

We call our symbols 'Traktor's Finger Symbols,' because author Traktor worked them up.

Each symbol stands for one of your fingers. As

you will discover, we don't have to make any differentiation between your left hand and right hand, so the identical symbols stand for either.

● The Circle means the first finger (either hand). Note that the circle has only 'one' point.

■ The Bar means the second finger. Note that the bar has 'two' ends.

▼ The Down-Triangle means the third finger. Note that the Down-Triangle has 'three' points.

✕ The X means fourth finger (seldom used). Note that the X has 'four' ends.

A chord has a base note called the 'root' and then some harmony notes. In our learning, it is very handy to keep track of that root, and to know which of several notes is the root. So, to show which finger's playing the root, the symbol is shown 'hollow' —

For example: ○ □ ▽ or ✕

We think you'll find this approach very easy.

Overview of the Books

Book 1 -- Easy Touch-Style Basics

This book is designed to provide a clear introduction to the two-handed tapping technique which we call 'Touch-Style'. The methods given here are not the only possible approach. In fact, these methods may not be the best or the simplest methods. They're just the best methods we know.

Here's what's included in this book ...

You will be shown how to put on an instrument and how to position your hands, so that you can get started. If you have not had any music theory training, this book will explain some methods musicians use to make written notes about what notes to play. These methods of making written notes about the notes to play are called, sensibly enough, 'Notation.'

Next you will be given an orientation that will show you where the notes are on the fretboard, in a useful way so that you can find and play the notes you will need. Then you'll be given a simple method of playing bass notes with your left hand, and playing melody notes and simple chords with your right hand. While learning this simple method, you will absorb the location of the notes without a great deal of effort, and you'll learn to move your fingers to play these notes. This basic knowledge of location and movement will be the basis of everything you will later learn.

There are two basic approaches to placing hands on a fretboard and playing notes.

1. One approach is to use some sort of 'Moving' system, where you learn certain shapes and then move them around the fretboard. For example, you might learn how to play an 'A' chord, and then move the same shape two frets up in order to play a 'B' chord.
2. The other to use some sort of 'Fixed' system, where your hands get placed — *and then stay where they are!* For example, you might place your hand on the fretboard near the tuners and then learn to play scales up and down by playing 3 notes on each string and moving across the strings, but not ever moving your hand to a location further from the tuners.

Of course, a proficient player can either play across the strings in one location, or he can play

up and down the strings with the hand positioned in different places. However, even that proficient player had to start in *one place*, and for this particular method we're going to start with a Fixed Position system where you place your hands in one place and learn to play there.

The simple but powerful method presented here is called the "Bookmark Method", because just as a bookmark helps you keep your place when navigating a novel, so does this Fixed Position method help you to keep your place about where the notes are! Further, you will be able, rather speedily, to play both scales and chords in one place with quite musical results.

In later books, the Bookmark system is expanded and then tied into a moving system called the 'LongFinger' system, which shows how to play chord shapes in different places along the fretboard, and to play improvisational scales placed over these chord shapes.

So we're not casting a vote that a Fixed Position system is *better* than a Moving Position system, but we *are* deciding to *start* there.

In book one, therefore, you will learn a fixed position upon which to place both hands — left hand over the bass notes and right hand over the melody (or harmony) notes. You will learn the notes by name for your left hand and your right hand. This will form the basis for your later playing melody with either hand.

You will then learn how to arpeggiate chords in that position (in each hand), and then you will learn how to choose two notes from the arpeggiated chord to form a simple two-note chord, so that you can begin playing bass notes left hand and chords right hand, in a rhythmic and musical manner.

You will notice that we are talking about a system that would be primarily useful to a bass-player. As the system is expanded in later books you will learn other techniques that would be more useful if you wanted to play, for example, a solo coffee-house performance, or if you needed to take a melody solo over bass-hooks as the new band member on a Rolling Stones tour.

In this book, we will concentrate on a simple approach which will take you quickly to some familiarity with your instrument, and make you quickly able to generate musical results. You will also be given some songs and shown how to use the Bookmark System to play them.

Although book one is only an introductory

book, the introductory Bookmark System, although rather simple, is enough to enable you to play simple jobs as a bass player — an unusual bass player who can play bass notes and rhythmic chords at the same time!

The Bookmark System, given only reasonable and regular practice, will make the instrument and the technique yours. The system is not difficult. In fact, it's rather easy. That's why we call this book 'Easy Touch-Style Bassics.'

Book 2 — Easy Touch-Style Rhythm

In this book, we will complete our discussion of chord shapes by covering the minor-seven chord, and (briefly) the minor-seven-flat-five chord.

We can then consider an expanded chord progression of four chords that occur frequently in most styles of music, so that you can now play the Six Noble Rhythms through all the most common chords. This “Master Exercise” takes only a few minutes daily, but forms the basic building block of simple “folded chords” on which the entire “Bookmark System” is built.

Next, we'll introduce Standard Notation, which is the common, world-wide method of writing down music. To keep learning simple, at first we'll concentrate only on how rhythm is written, so that you can expand your own bass and chord rhythms to include useful rhythms that you can now read. In this way you are beginning to read music. (And of course, you can begin to write down your own rhythmic notation as well.) We will also cover the basics of the Walking Bass technique. At this point, you could begin a career as a bass-player, if you wished.

Book 3 -- Touch-Style Melody

This book expands the Bookmark System by adding a set of rich-sounding left-hand chords. By now, just by practicing the Six Noble Rhythms (that “Master Exercise” with which the Bookmark System is developed), you've learned where all the bass (or “root”) notes are located.

Now you will discover that it's easy to build a simple set of chord-forms on these bass roots, for a complete set of left-hand chords. You can now generate powerful rhythmic tracks using both the simple right-hand “guide-tone” chords with these new left-hand chords. They can be combined in a myriad of ways: struck rhythmically in alternations, arpeggiated, interleaved, and quite a lot

more.

And now that you can provide easy left-hand harmony, we'll introduce reading melody written in Standard Notation, using the popular “leadsheet” format which contains only a single staff to read, with chord symbols for your left hand marked above.

You will discover that, broken down step by step in this fashion, it's not very hard to learn to read, and of course you can now also begin to write down your own compositions, so that others could read and play them.

At this point, you could begin a career of coffee-house gigs as a solo act, if you wished.

Book 4 -- Touch-Style Improv

At this point, you already know the notes below your left hand and your right hand. You can play simple chords with either hand, you can read and play melody while adding bass or left-hand chords. It's time to learn to improvise!

Many years ago, a young man in Germany named Werner Pohlert fell in love with American jazz, and spent a lifetime playing in clubs, and in teaching. He developed an unusual way of looking at western harmony, quite different from conventional teachings.

Among the methods he developed was a system of improvising that permits any student to begin improvising almost immediately! Unlike the usual approach which requires you to learn many, many “chord-scales” and to perform lightning calculations as you play, Pohlert's method uses only *one* simple six-tone scale. This scale is applied directly to one kind of chord, and applied as a “substitution” for three other kinds of chords. So there are only four rules! With these four rules, using this one six-tone scale, you'll be delighted to learn that you can play fluid and pleasing improvisations over any set of chord changes!

With this (surprisingly simple) ability to improvise — to make up your own melodies in real-time — you can now experience the powerful “Eight-Folding Path.”

The Eight-Folding path uses the folding chord shapes you've learned as the basis of the Bookmark system, and shows you how to work up a song in eight ways: First you play the melody (with both hands simultaneously), then play the melody with bass roots, then the bass roots with rhythmic chords, then by arpeggiating the chords, then improvising over bass roots, then improvise-

ing over left-hand chords, then rhythmically jamming with chords in each hand, and finally playing the melody over left-hand chords!

It may sound like a lot but you already have learned all the parts! You can now quickly work up a song using this as an exercise, and merely by selecting several parts from the Eight-Folding Path, you have a wide variety of ways to present the song, as a bass-player, as a rhythm player, or as a soloist.

You could now begin a career as a rounded touch-style musician, if you wished. You can handle the top. You can handle the bottom. You can read. You can improvise.

You're a musician, dude.

Book 5 -- Touch-Style Performance

The Bookmark System you have learned contains within it a number of "hooks" that enable you to extend your technique. So next you'll learn an array of compatible methods that build off the Bookmark System. For example ...

Since you've learned to read one stave so as to play "leadsheet" melodies, it makes sense to look at learning to read two staves like a piano player does. You'll learn to read basslines and melody lines at the same time, just like a piano player does. At this point, you'll find it's not that difficult to do.

You'll learn the "LongFinger System" which is a *moving* system. Up to now, the entire Bookmark System has been a *fixed* system, permitting you to place your hands on one area, and you were able to learn the entire Bookmark System without the need to move your hands! (That's one reason the Bookmark System is fast to learn.)

But now you'll discover a simple moving system whereby you can move both hands in parallel, and so play chord forms and related scales up and down the fretboard, a complementary system that opens up new areas of the fretboard for exploration.

You'll learn simple chord "substitutions" so that you can enrich the harmony of pieces you play. You'll learn how to write simple "Intros" to a song you're playing, as well as "Outros" to end off the song. And you'll learn a lovely way to harmonize a melody using sixths intervals with your right hand.

These methods are designed to enable you to expand your performance repertoire, and open up new directions for your music.

Book 6 -- Touch-Style Gigging

This 'Nuts and Bolts' book concentrates more on the things you might find helpful if you are regularly performing in public. All the study in the world in playing music doesn't provide much of a clue about how to go about gigging. So if a life playing music is what you want, here you'll learn some "rules of the road", including how to go about getting gigs, how to create promo, how to build a life that permits gigging, and how to increase the profitability of your musical performances.

This book also discusses some of the basic 'how to run a business' facts which you will need if you want to get jobs and approach music as a way to earning a living, or earning part of your living. This book contains little about how to play music, but it's a very useful handbook in how to play life.

The Bookmark System

In Book One you learn the basic Bookmark System, including how to place your hands on the instrument, how to train your hands simultaneously, how to play the most common chords, and how to split the bass and the rhythmic chords between your two hands.

In Books Two through Four you expand the Six Noble Rhythms master exercise into familiarity with common chords. This trains your hands to be quick and smart — they learn the path, and then they can walk it without a lot of worry on your part.

Staying in one place improves accuracy and confidence, and opens up new techniques of interplay between the two hands. Remember that this system begins by showing you how to play while keeping your hands in one place, and that's why it's called the Bookmark System.

As you experiment with this system, you will discover that your left hand teaches your right hand, and your right hand teaches your left hand! With these guys helping you, you'll make good progress!

This Master Exercise makes your instrument familiar to your hands, and trains your hands to know the path they'll generally be walking during play. Just like riding a bicycle, once you have learned it, you can think about the terrain ahead while your feet and your balance take care of themselves. So will your hands serve you once the Master Exercise is familiar to your fingers.

Have you ever noticed that, when you whistle a tune, you just think about the tune and you don't have to think about moving your mouth? If you will merely practice, playing your instrument can be the same. You can think about the tune you're playing, and not about moving your hands. The Six Noble Rhythms master exercise will help.

The Master Exercise is especially useful in that everything you will learn while 'exercising' can be used when playing songs. Even better, learning the Master Exercise is not difficult, and once you learn it, you can cycle through all the musical keys so that playing in any key becomes comfortable.

The Bookmark System and this Master Exercise are expanded in the books that follow, adding reading rhythm and melody, left-hand chords, and improvisation. This enables you to follow the "Eight-Folding Path" which is a multi-view approach to working up any song.

By the end of Book Four you'll be able to work up any song, and play almost anything, laying down bass tracks, complex rhythms, melody and improve.

Book Five is the icing on the cake, and the opening of doors into new musical lands.

Book Six is about playing music in the world.

And all through the method, you learned building blocks that can be used to play real music, right now. You are able to train your hands simultaneously to greatly increase your learning speed, you have powerful "warm-up" exercises, and you can function as a competent musician in the world.

Welcome to the world of touch-style music, and thank you for your interest in the Easy Touch-Style Method.

The Bookmark System — Locating the Notes

Where Are the Notes?

Before you can play a note you need to know where it is!

OK, but just looking at the fretboard and the strings there are many, many notes. We can't start everywhere. We've got to start in one place. So where should we start?

Or put another way: What are the most useful notes to know?

For a bass-player, that answer is easy: *The most useful notes to know are the low ones!*

How many notes must we know to start playing songs?

To play one particular song you could possibly get by with two or three notes. But in general it will be useful to know one octave of notes. (The words 'octave' means 'eight', and there are eight notes in an octave.) *So we'll learn eight notes.*

So where do we start? *We start by learning eight low notes.*

The Three Tunings:

Although touch-style can be done on almost any instrument in almost any tuning, we have to talk specifics in this method book. So we're not going to talk about variations such as tapping on mandolins, or special guitar 'open-tunings' or 'Crafty tuning'. We're not going to talk about special megatar tunings such as those called 'baritone' or 'half-bari' or 'mirror' or 'uncrossed hands' tunings. We're not going to talk about special stringing such as 7-string guitar. Any of those special tunings can be worked out by the student who wishes to do so.

In this set of books, we will however, present the Long-Finger and Bookmark systems as applied to the three most common tunings used for specialty tapping instruments --

■ An 8-string bass ('Bass' for short) tuned in the common way that a bass player would normally choose, meaning that the lowest string played open would be a Low-B, and the next string played open is the Low-E. (This Low-E on the second string is the same as the Low-E on the lowest string of a standard 4-string bass.) All strings tuned in straight fourths up from there.

■ A 'Bass-Bottom' 6x6 megatar ('Megatar' for short) A 'megatar' means a specialty tapping instrument with two groups of strings on the same neck, one set for bass and one set for melody. '6x6' means there are six strings in the bass set, and there are six strings in the melody set. The standard tuning for the megatar's melody strings is similar to guitar, but 1.5 steps lower and tuned in straight fourths. The lowest melody string on megatar played open would be C#, and then tuned in straight fourths ascending from there.

By 'Bass-Bottom' we mean that the bass set of strings is tuned like a standard 6-string bass, meaning that the lowest string played open would be a Low-B, and the next string played open is the Low-E. All bass strings tuned in straight fourths up from there.

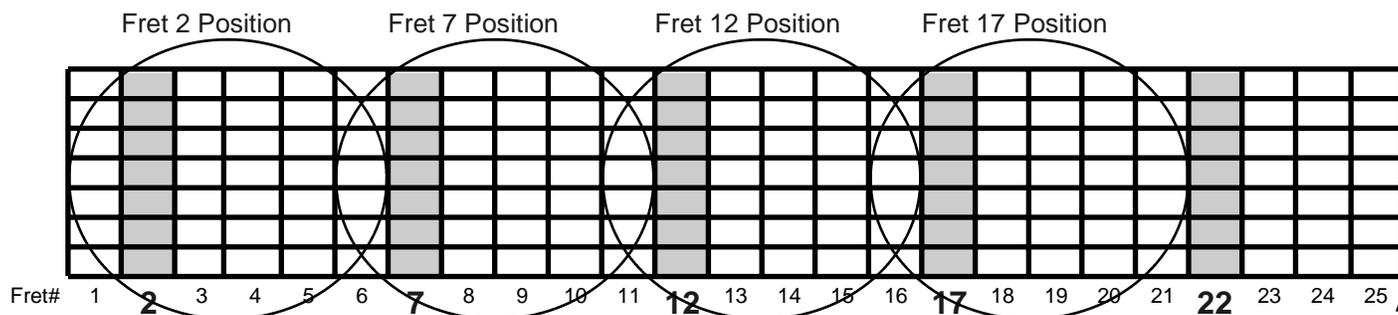

■ A 'Fifths-Bottom' 6x6 instrument ('Fifths' for short) This type of instrument is a megatar by definition (ie.: it's a specialty instrument made for two-handed tapping, with a group of strings for bass and a separate group for melody). However, to avoid confusion with the Bass-Bottom megatar above, we'll just refer to it as an 'Instrument.' This is a 6x6 instrument where the bass strings are tuned in the 'inverted fifths' system popularized by players of the 'Chapman Stick'®.

We didn't want to call it a 'Fifths-Tuned' instrument as that's also confusing in discussion in that the melody side of this instrument is tuned in fourths and only the bass strings are tuned in inverted fifths. So 'Fifths-Bottom' seemed clearer.

The Chapman company actually patented this tuning, but that patent has expired and the tuning has become popular, especially in that it affords a nice-sounding group of left-hand chords.

In the 'Fifths-Bottom' instrument, the lowest bass string is in the Middle of the fretboard rather than on the near edge, and the strings are tuned in ascending fifths as you move toward the near edge of the fretboard. That is, as you play ascending bass notes across the bass strings from the largest bass string toward the smallest bass string, your left hand is moving toward your chin. The lowest bass string, played open, is tuned to C, the next-lowest string tuned to G, the next string to D, and so on.

Four Fretboard Regions provide Four Hand Positions

An odd note regarding Megatar bass strings in Fourths, compared to Fifths-Bottom bass strings in Inverted-Fifths — If you examine the note names of the open bass strings, you discover that even though the tunings ascend in opposite directions, the note names are the same! That is, the open note of the bass string nearest your chin is B, and the open note of the bass string near the middle of the fretboard is C!

Fret-Markers at 2, 7, 12, 17, & 22:

Many antique and ethnic instruments, and many specialty tapping instruments have special markings at frets 2, 7, 12, 17, and 22. These particular fret markings stand out like large landmarks on the fretboard. These special markings identify regions of the fretboard where one can find very similar patterns of notes, that is, a pattern of notes played just above fret 2 can often be played with the same finger-shape just above fret 7 or fret 12. (This handy fact will be later explained in detail.)

For our purpose in navigating around the fretboard, we will organize our navigation around these large landmarks.

If your instrument doesn't have these frets specially marked, you will find your learning easier if you will mark them. Stick some colored tape to the fretboard just behind frets 2, 7, 12, 17, and 22. (In this case, by 'behind fret 2' we mean between fret 1 and fret 2.)

Yes, if you stick tape on your fretboard, it will probably be real annoying to clean it off after a while, but you are going to find these special fret markings to be helpful over and over and over again. (Some of the Arvey-brand office stickums, or the Post-It Notes, or good old Masking Tape will probably come off with minimal mess and crud left on your fretboard.)

Or, you could buy a different brand of tapping instrument -- one that has special markings at 2, 7,

12, 17, and 22!

Fretboard Regions and Hand Positions:

When you look at your instrument, you see that the lowest notes on the bass strings are found on the largest strings and at frets close to the instrument's nut. Because these notes are in the near vicinity and above a large landmark -- that is, the noticeably marked Fret #2 -- we're going to refer to this general area as the 'Fret 2 Position', as generally shown by the leftmost large circle on the graph.

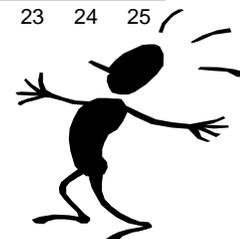

Although the notes in the Fret 2 Position are clearly the lowest notes, there are sometimes advantages to be found in playing at the next position, which is in the near vicinity and above the major landmark we call Fret #7. We will refer to this general area of the frets near Fret #7 as 'Fret 7 Position'.

Before we go on, please notice that there's a difference in sound between Fret 2 Position and Fret 7 Position.

The notes at Fret 2 Position have longer string lengths, so they have more overtones, which makes them growlier, and perhaps 'richer', with greater character.

The notes at Fret 7 Position have shorter string lengths so they have more midrange, which produces a punchier and simpler sound with greater pop. You as an individual might use completely different words to describe the sound of notes at these two positions, but if you'll play some notes at each of the two positions, we're sure you'll agree that the notes at Fret 2 Position have a different quality of sound than the notes at Fret 7.

Later on when you're playing songs in performance, sometimes you will want to play the notes at Fret 2 and other times you will prefer to

8-String Bass — Left-Hand Low Notes

On Bass, your left hand is generally going to be playing at Fret 2 Position.

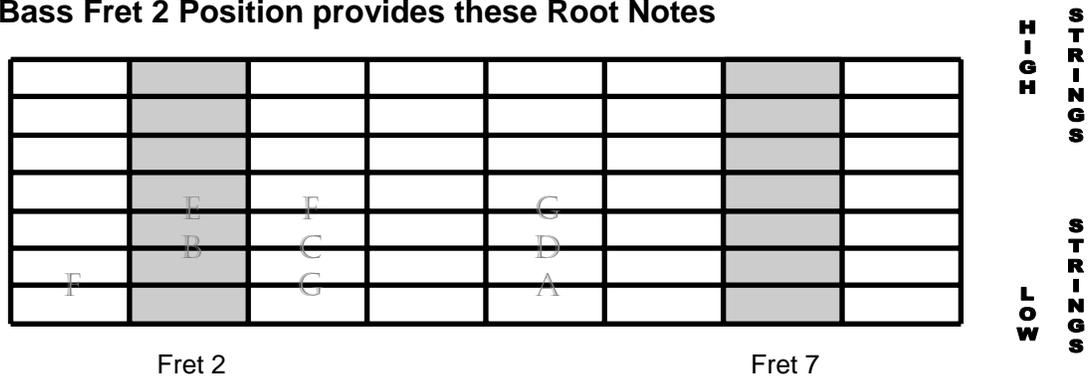

The notes at Fret 7 Position also work well, but the notes down in Fret 2 Position are growlier and more 'obvious' to a bass player. And yes, the notes down in Fret 2 Position contain the lowest notes on each string. And naturally, bass players like low notes.

You will notice that any note on Fret 1 — for example, the 'F' shown in this graph — may require a little more finger muscle to sound because, on most instruments, there is a fabric string-deadener woven into the strings at Fret 1. Just give it a slightly stronger tap, and you're in business.

The Fret 2 Position does not initially use the very lowest string, but be sure to position your hand so that you *could* reach the lowest string, because we'll want that lowest string later. The primary key to making it easy for your left hand to easily reach all the way across the fretboard is to have your instrument positioned in an upright position, so that you can have your left wrist and fingers generally straight. When your left wrist is straight, the edge of the fretboard falls into the *web* of your thumb and your fingers can comfortably reach the furthest, largest string.

The Fret 2 Position, as you will soon see, offers the benefit that you can operate your two hands in exactly identical fashion, which lets you learn useful technique approximately twice as fast.

Bass Fret 2 Position provides these Root Notes

8-String Bass — Left-Hand Fingering

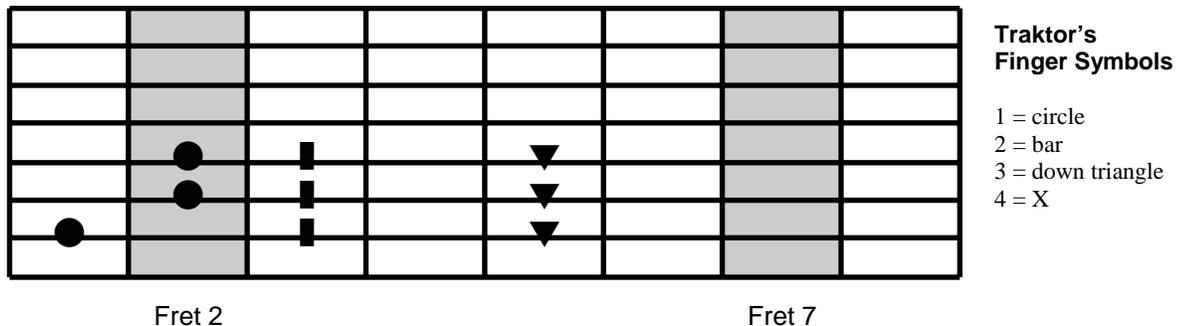

As you can see, there are three notes per string. To play these notes from the lowest to the highest, use three left-hand fingers to play three notes, then go to the next string and again use three fingers to play three notes, and then to the next string and do the same. (In this system, your little finger will not normally be used in scalar playing.)

Please try playing these nine notes, up and down. Notice that the F and the G note are repeated. If you were playing the root of an F-Chord, which F note would you choose?

As a bass player, your general rule will be to play the *lowest* one.

Using fingering as shown, please learn these nine root notes now.

Bass Left-Hand Fingering for Root Notes

Bass-Bottom Megatar — Left-Hand Low Notes

On Bass-Bottom Megatar, your left hand is generally going to be playing at Fret 2 Position.

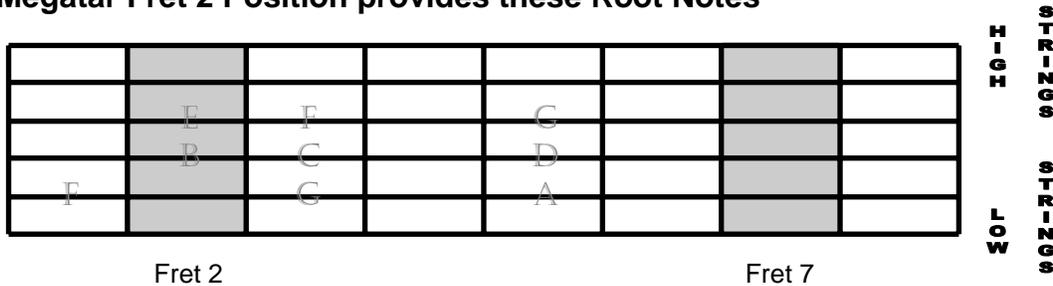

The notes at Fret 7 Position also work well, but the notes down in Fret 2 Position are growlier and more 'obvious' to a bass player. And yes, the notes down in Fret 2 Position contain the lowest notes on each string. And naturally, bass players like low notes.

You will notice that any note on Fret 1 — for example, the 'F' shown in this graph — may require a little more finger muscle to sound because, on most instruments, there is a fabric string-deadener woven into the strings at Fret 1. Just give it a slightly stronger tap, and you're in business.

The Fret 2 Position does not initially use the very lowest string, but be sure to position your hand so that you *could* reach the lowest string, because we'll want that lowest string later. The primary key to making it easy for your left hand to easily reach all the way across the fretboard is to have your instrument positioned in an upright position, so that you can have your left wrist and fingers generally straight. When your left wrist is straight, the edge of the fretboard falls into the *web* of your thumb and your fingers can comfortably reach the furthest, largest string.

The Fret 2 Position, as you will soon see, offers the benefit that you can operate your two hands in exactly identical fashion, which lets you learn useful technique approximately twice as fast.

Megatar Fret 2 Position provides these Root Notes

Bass-Bottom Megatar — Left-Hand Fingering

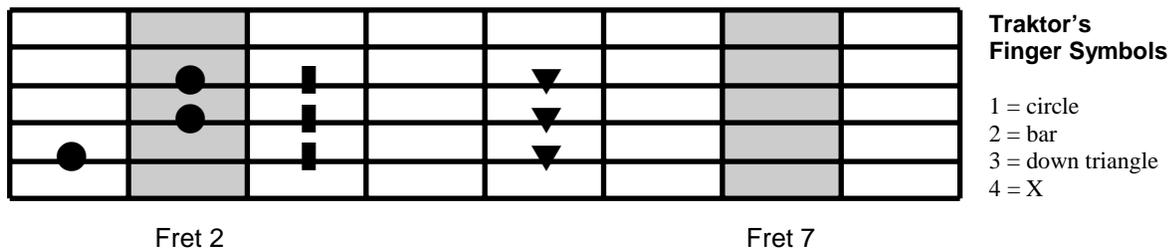

As you can see, there are three notes per string. To play these notes from the lowest to the highest, use three fingers to play three notes, then go to the next string and again use three fingers to play three notes, and then to the next string and do the same. (In this system, your little finger will not normally be used in scalar playing.)

Please try playing these nine notes, up and down. Notice that the F and the G note are repeated. If you were playing the root of an F-Chord, which F note would you chose?

As a bass player, your general rule will be to play the *lowest* one.

Using fingering as shown, please learn these nine root notes now.

Fifths-Bottom Instrument — Left-Hand Low Notes

On Fifths-Bottom instrument, your left hand is generally going to be playing at Fret 2 Position.

Your position is different from Bass and Bass-Bottom Megatar because your low strings are located differently. However, notice that the *Shape* and the *Note-Names* of these nine notes are *Identical* to the shape and note-names give on the previous pages for Bass and for Bass-Bottom Megatar!

One of the powerful features of this system is that what you learn for one tuning can be applied to the other tuning with very little modification.

If you can play these notes in this shape with your left hand on your 'Fifths' instrument, then you can pick up an 8-String Bass or a Bass-Bottom Megatar and begin playing almost immediately.

If you can do pushups on the driveway, you can do pushups on the lawn!

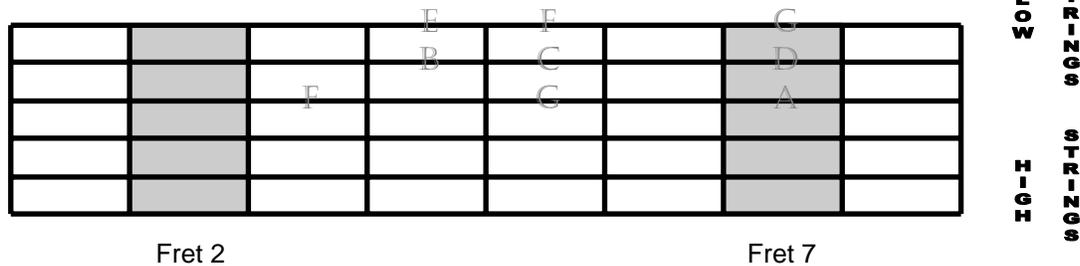

There are, of course, other ways to play roots on the Fifths-Bottom instrument. For example, you can play all the roots on the two lowest strings (D, E, F, & G on lowest string, and A, B, C, & D on next lowest string).

However, the position as shown below enables you to play these roots without moving your hand, which will improve your initial learning accuracy.

Further, this position as shown below will later allow you to operate your two hands in exactly identical fashion, which lets you learn useful technique approximately twice as fast.

So for now, use Fret 2 Position as shown for learning this system. It will pay dividends.

Fifths-Bottom Fret 2 Position provides these Root Notes

Fifths-Bottom Instrument — Left-Hand Fingering

As you can see, there are three notes per string. To play these notes, use three fingers to play three notes on one string, then go to the next string and again use three fingers to play three notes, and then to the next string and do the same. (In this system, your little finger will not normally be used in scalar playing.) Please try playing these nine notes, up and down.

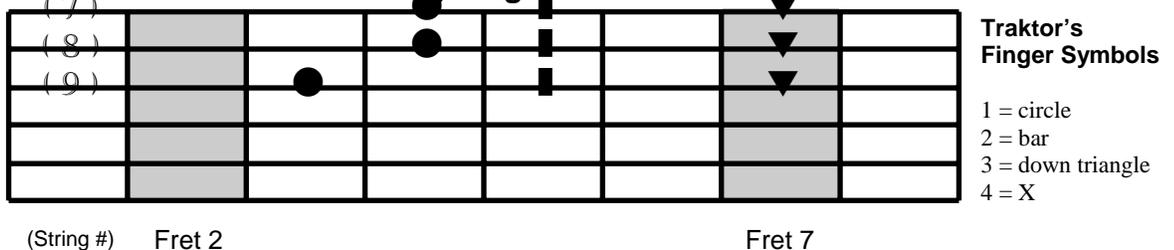

Notice that it doesn't sound quite scale-like. On string #7 (lowest-pitched string) you ascend to the note G, and then sort of leap up to the note B on string #8. Then on string #8 you ascend to the note D, and then again leap up to the note F on string #9.

Try it the other way, starting your notes on string #9. Play three notes on string #9, then three notes on string #8, then the three notes on string #7. Now the notes are scale-like, but there's an octave drop between each string! An odd sound! However, for learning our roots in this system, this will work fine!

Also, notice that the F and the G note are repeated. If you were playing the root of an F-Chord, which F note would you choose? As a bass player, your general rule will be to play the *lowest* one.

Using fingering as shown, please learn these nine root notes now.

Fifths-Bottom Left-hand Fingering

8-String Bass — Right-Hand High Notes (for Melody or Harmony)

Now we must select an area among the melody strings to place your right hand. We want...

- A right-hand location where your two hands won't collide, so that means *higher up the neck*, and
- A right-hand location where your right hand can finger the *exact same pattern of notes* as those low notes under your left hand.

There are three possibilities. The first, near fret seven, gives us neat access to the top strings, but it's way too close to the left hand. It would be worrisome playing there, and later on when we investigate left-hand chords, the hands will interfere with each other.

Another possibility places the right hand around

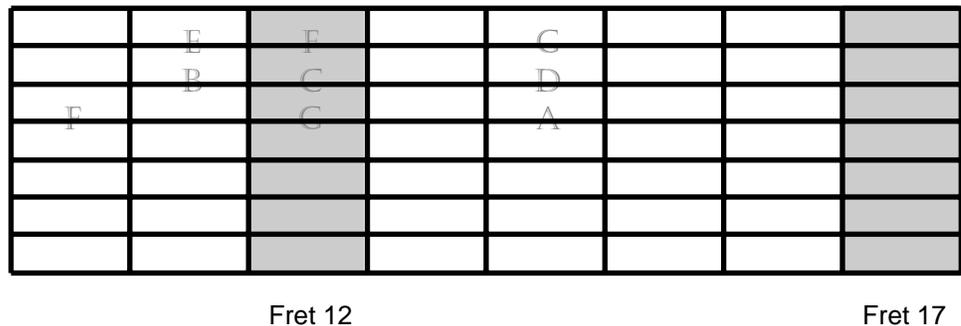

the seventeenth fret but both the left and right hand would sometimes use string #5. Clumsy.

The best position appears to be to place the right hand at the Fret 12 position as shown. This gives you three strings for the left hand, and then three for the right hand (and a couple more high strings accessible for the right hand when later playing scalar melodies).

It's a little clumsy that the left hand only gets to use three strings before encountering strings appropriated by the right hand, but that's the breaks in the world of 8-string bass. As you will see, having separate groups of strings as megatars do solves exactly this kind of problem.

So for 8-String Bass, here are the notes you want —

Bass Fret 12 Position provides these Scale Notes

8-String Bass — Right-Hand Fingering

The pattern and note names are IDENTICAL to your left-hand low notes, so there are still three notes per string. To play these notes from the lowest to the highest, use three right-hand fingers to play three notes, then go to the next string and again use three fingers to play three notes, and then to the next string and do the same.

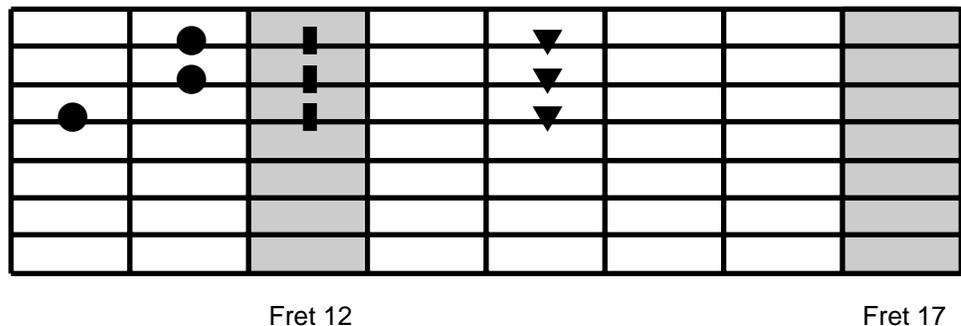

Please try playing these nine notes, up and down. Notice that you get two F and two G notes..

Using right-hand fingering as shown, please learn these nine melody notes now.

Traktor's Finger Symbols

- 1 = circle
- 2 = bar
- 3 = down triangle
- 4 = X

Bass Right-Hand Fingering (Melody Notes)

Bass-Bottom Megatar — Right-Hand High Notes (for Melody or Harmony)

Now we must select an area among the melody strings to place your right hand. We want...

- A right-hand location where your two hands won't collide, so that means *higher up the neck*, and
- A right-hand location where your right hand can finger the *exact same pattern of notes* as those low notes under your left hand.

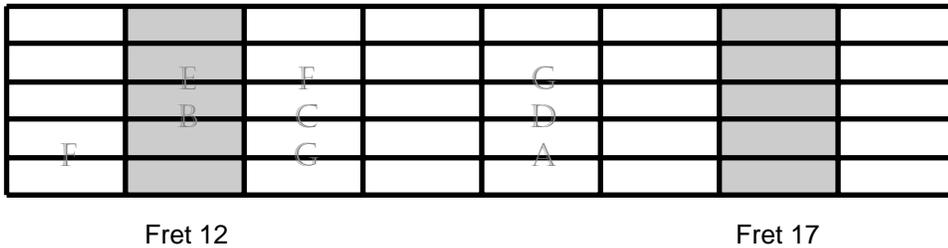

The best position available places the right hand at the Fret 12 position as shown. This makes your right hand identical to your left hand in that you're starting the pattern on the lowest string of the group. (ie.: the left hand begins the pattern on

the lowest bass string, and the right hand begins the pattern on the lowest melody string.)

Further, the patterns occur in identical visual relationship to the specially-marked frets 2 and 12. For example, the lowest bass G-note is one fret up from specially-marked fret 2, and the lowest melody G-note is one fret up from specially-marked fret 12.

Each hand has a lot of open strings above the pattern, which means that later after you've mastered three strings and you want to wander higher, each hand has exactly the same universe waiting above! This is a good thing.

Megatar Fret 12 Position provides these Scale Notes

Bass-tuned Megatar — Right-Hand Fingering for Melody Notes

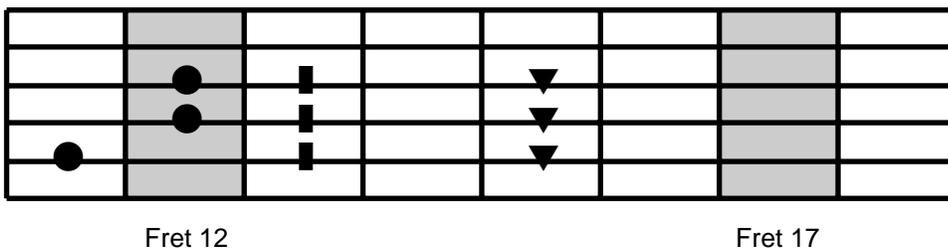

The pattern and note names are IDENTICAL to your left-hand low notes, so there are still three notes per string. To play these notes from the lowest to the highest, use three right-hand fingers to play three notes, then go to the next string and again use three fingers to play three notes, and then to the next string and do the same.

Please try playing these nine notes, up and down. Notice that you get two F and two G notes..

Using right-hand fingering as shown, please learn these nine melody notes now.

NOTE: The Bass-Bottom Megatar has the best of all worlds in that the left-hand bass notes and the right-hand melody notes have absolutely identical patterns and are positioned relative to the special dot-markers in an exactly identical fashion.

Megatar Right-Hand Fingering (Melody Notes)

Traktor's Finger Symbols

- 1 = circle
- 2 = bar
- 3 = down triangle
- 4 = X

Fifths-Bottom Instrument — Right-Hand High Notes (for Melody or Harmony)

Now we must select an area among the melody strings to place your right hand. We want...

- A right-hand location where your two hands won't collide, so that means *higher up the neck*, and
- A right-hand location where your right hand can finger the *exact same pattern of notes* as those low notes under your left hand.

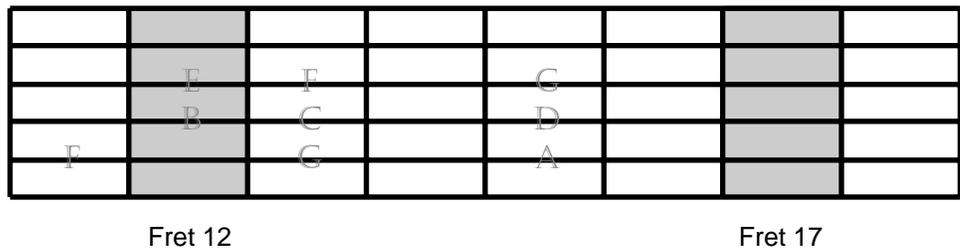

The best position available places the right hand at the Fret 12 position as shown. This permits your right hand to play the identical pattern of notes as are played by your left-hand on the bass strings.

We have placed the right hand on the *lowest-*

pitched of the melody strings, which are nearest the center of the fretboard. This is similar to the way we placed the left hand on the *lowest-pitched* of the bass strings. Visually the two hands look a little different relative to the specially-marked frets. However, each note pattern is identical, and each note pattern is placed on the lowest-pitched strings available.

The right hand positioning will also work out nicely later when you wish to play melodies from written music, as this position gives you access to all the notes normally found on a 'treble-clef' or a 'leadsheet' of music, and these notes fall nicely under your fingers.

Fifths-Bottom Fret 12 Position provides these Scale Notes

Fifths-Bottom Instrument — Right-Hand Fingering

The pattern and note names are IDENTICAL to your left-hand low notes, so there are still three notes per string. To play these notes from the lowest to the highest, use three right-hand fingers to play three notes, then go to the next string and again use three fingers to play three notes, and then to the next string and do the same.

Please try playing these nine notes, up and down. Notice that you get two F and two G notes.

You will also notice that, since the melody strings are tuned in fourths, you can ascend and descend in a strictly scalar fashion, with no octave leaps as you experienced when playing the left-hand bass notes.

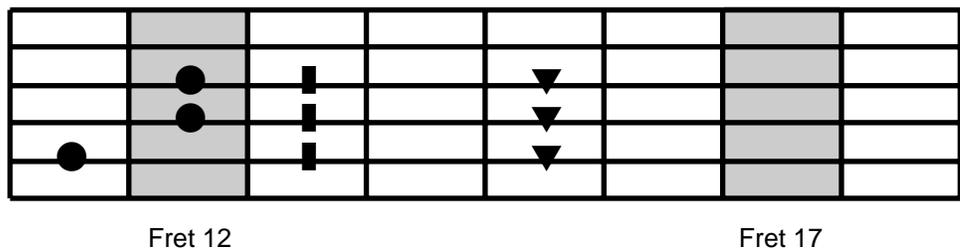

Using right-hand fingering as shown, please learn these nine melody notes now.

Note: The melody side of Bass-Bottom Megatar and Fifths-Bottom Instrument are identical.

Traktor's Finger Symbols

Fifths-Bottom Right-Hand Fingering (Melody Notes)

Comparing the High Melody/Harmony Notes on all Three Instruments

For clarification, here are all three instruments with the Right-Hand High Notes marked.

As you can see, the Bass-Bottom Megatar and the Fifths-Bottom Instrument play the High Notes exactly the same, because their Melody Strings are tuned identically in fourths. On these instruments the lowest-pitched melody string is the string at the bottom of the graph.

On the 8-String Bass, however, there is only one group of strings, and you've already told your left hand it could have the bottom three strings for bass notes, so your first opportunity to place the melody note-pattern is on the fourth string from the bottom.

One difference becomes apparent, in that you can see that the 8-String Bass has both hands playing in one group of strings, so that keeping

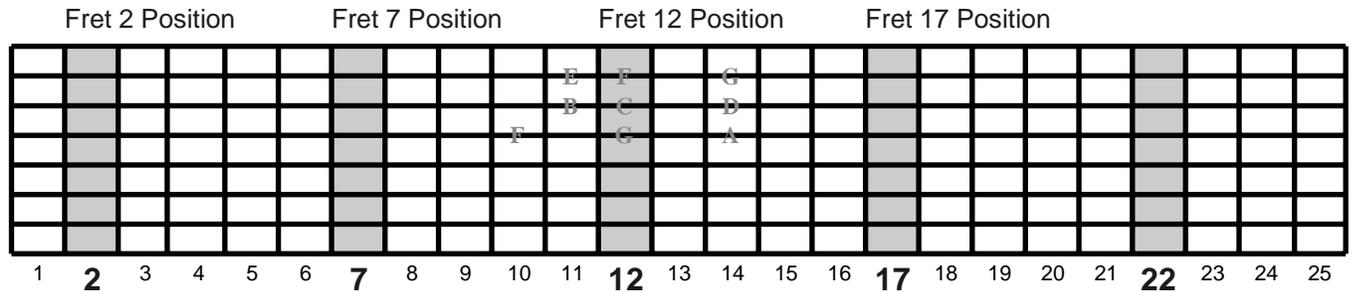

your left-hand fingers and your right-hand fingers off the identical string becomes an issue.

On the Megatar and Fifths-Bottom Instrument, however, this is a non-issue. In fact, the very reason for having two separate groups of strings on one fretboard is to allow each hand free play within the string group without interference from the other hand.

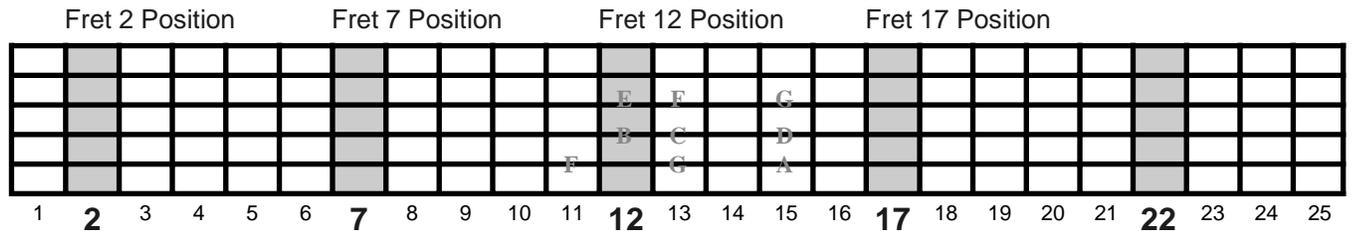

But, differences aside, the most important fact is that all three instruments have the IDENTICAL note pattern. Further, it sounds the same played on all three instruments because the melody strings on all three instruments are tuned in fourths.

And remember, on each of these instruments your right hand on high notes is playing the exact same pattern of nine notes as is your left hand on the bass notes. It's a thing of beauty.

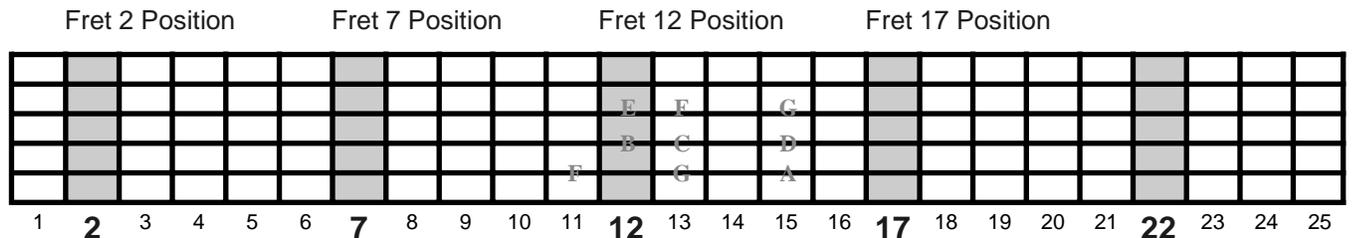

Eight-String Bass — Right-Hand High Notes (Melody)

Bass-Bottom Megatar — Right-Hand High Notes (Melody)

Fifths-Bottom Instrument — Right-Hand High Notes (Melody)

Putting Both Hands on the Instrument! First, the 8-String Bass ...

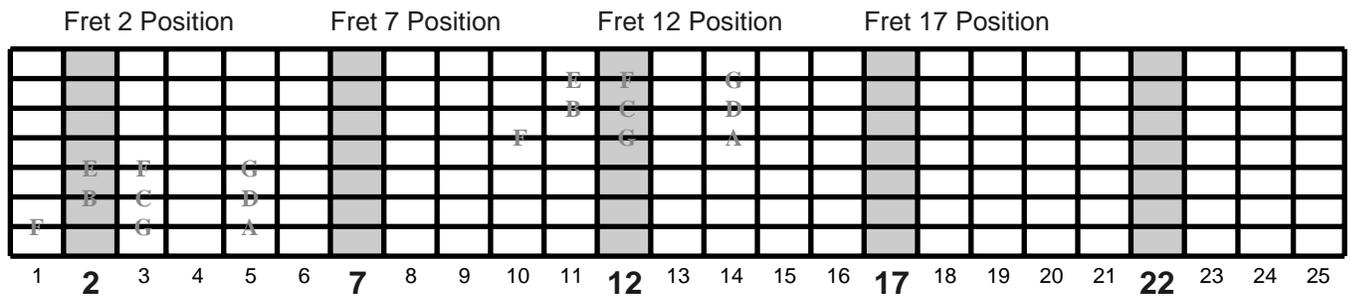

It has been perhaps a bit laborious, but we've now examined how the left hand is positioned on all three instruments, and we've examined how the right hand is positioned on all three instruments.

Our next step is to examine each instrument with *both hands* shown in position.

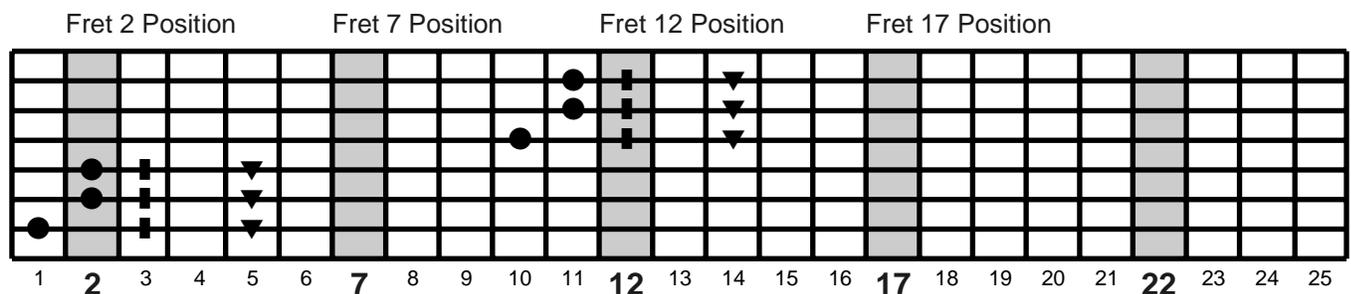

Don't be frightened. It will be easy.

First, here's an 8-String Bass ('Bass') showing the left-hand bass notes, and the right-hand melody notes ...

Eight-String Bass showing Bass and Melody Note-Pattern

Eight-String Bass Fingering for Bass and Melody Note-Pattern

That's not so tough!

And now the obvious experiment is for you to place both hands on the instrument, and play these notes like a scale, up and down.

First try the bass notes.

Then try the melody notes.

Then try playing the bass and the melody notes at the same time. Play legato (long and slow notes) and play right on the beat. As you play the scale up and down, put your attention into your fingertips and *feel* the fret beneath the string you're playing. You will get the best sound by

tapping right *on* the fret, but with most of your fingertip behind the fret (i.e., toward the tuners).

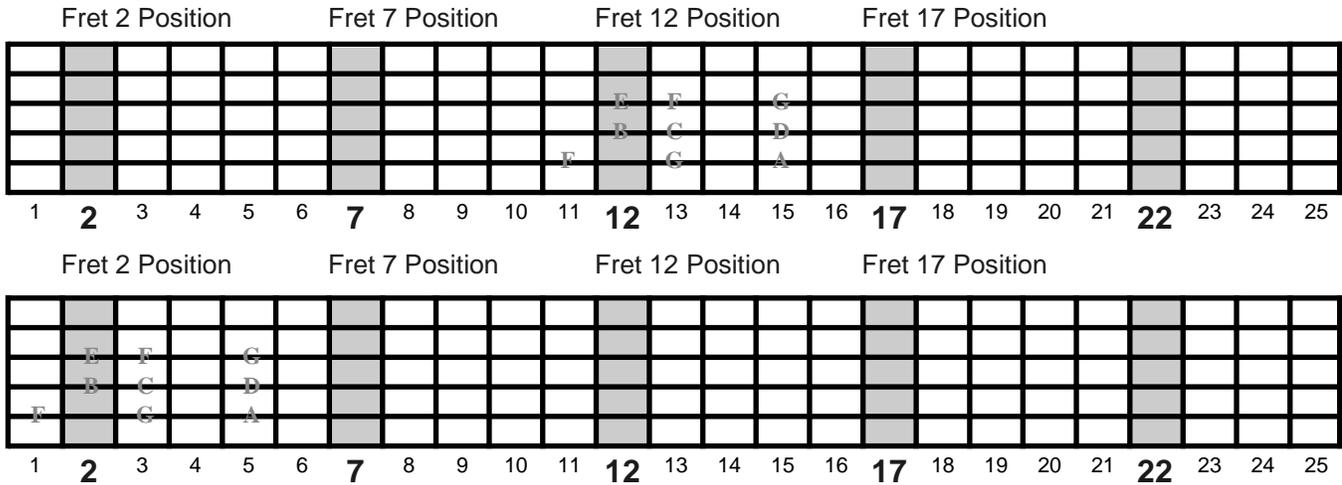

Feel the fingertips of first one hand and then the other. If you get a note that doesn't sound right, then place your attention into the fingertips of that hand and feel the frets.

Putting Both Hands on the Bass-Bottom Megatar —

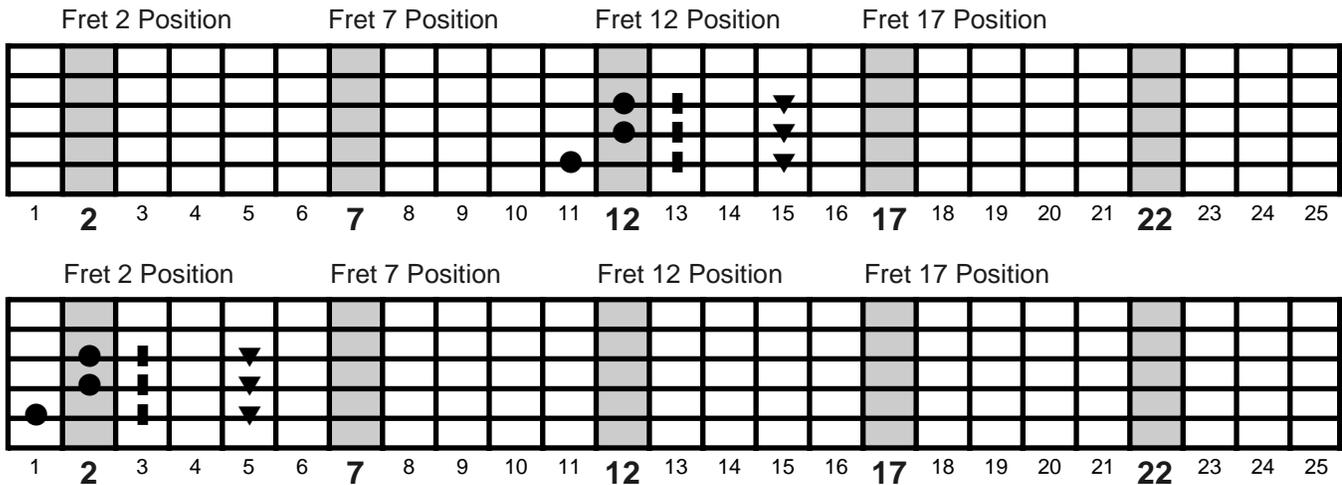

Our next step is to examine each instrument with *both hands* shown in position.

Here is a Bass-Bottom Megatar with both bass and melody note-patterns marked ...

Bass-Bottom Megatar showing Bass & Melody Note-Pattern

Bass-Bottom Megatar Fingering for Bass & Melody Note-Pattern

Now the obvious experiment is for you to place both hands on the instrument, and play these notes like a scale, up and down.

First try the bass notes.

Then try the melody notes.

Then try playing the bass and the melody notes at the same time. Play legato (long and slow notes) and play right on the beat. As you play the scale up and down, put your attention into your

fingertips and *feel* the fret beneath the string you're playing. You will get the best sound by tapping right *on* the fret, but with most of your fingertip behind the fret (i.e., toward the tuners).

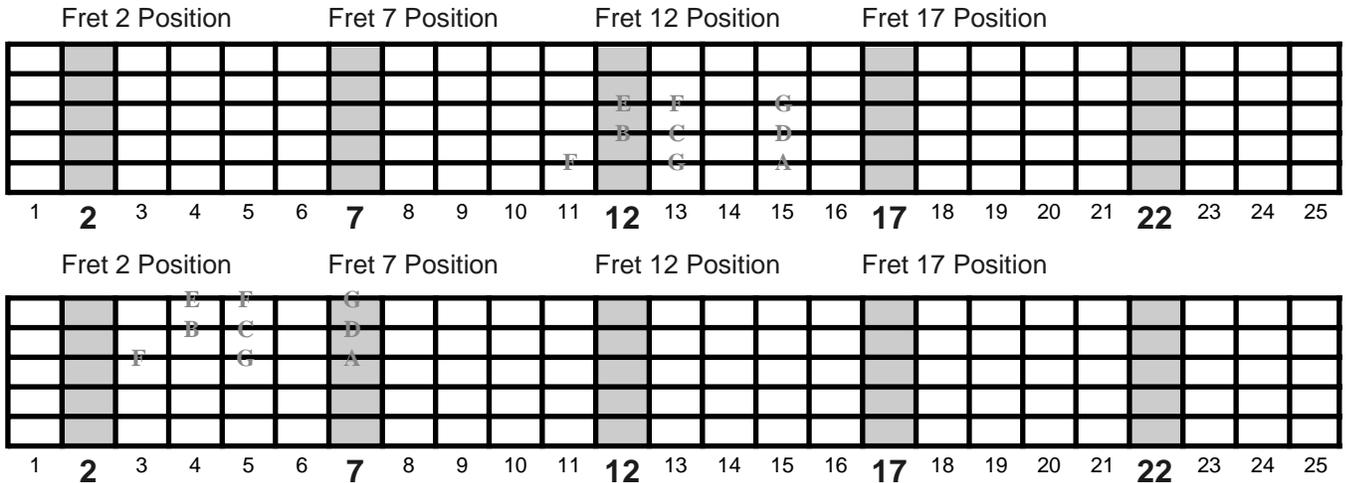

Feel the fingertips of first one hand and then the other. If you get a note that doesn't sound right, then place your attention into the fingertips of that hand and feel the frets.

Putting Both Hands on the Fifths-Bottom Instrument

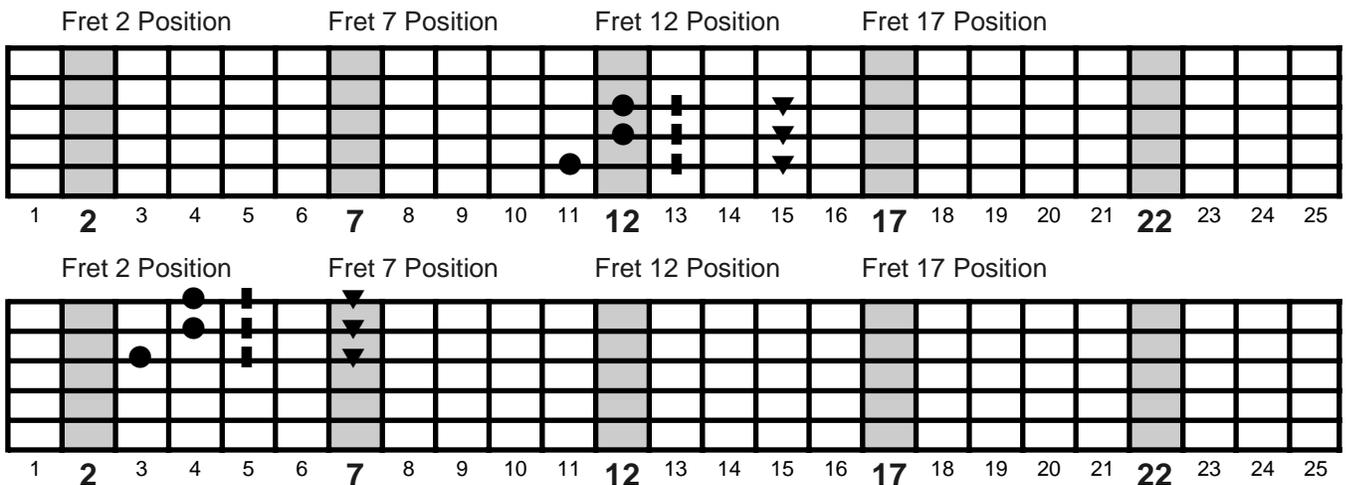

Our next step is to examine each instrument with *both hands* shown in position.

Here is a Fifths-Bottom Instrument with both bass and melody note-patterns marked ...

Fifths-Bottom Instrument showing Bass & Melody Note-Pattern

Fifths-Bottom Instrument Fingering for Bass & Melody Note-Pattern

Now the obvious experiment is for you to place both hands on the instrument, and play these notes like a scale, up and down.

First try the bass notes. Then the melody notes.

Then try playing the bass and the melody notes at the same time. Play legato (long and slow notes) and play right on the beat. As you play the scale up and down, put your attention into your fingertips and *feel* the fret beneath the string

you're playing. You will get the best sound by tapping right *on* the fret, but with most of your fingertip behind the fret (i.e., toward the tuners).

The bass notes will have octave drops as you play *up* the scale, but it will sound OK.

Feel the fingertips of first one hand and then the other. If you get a note that doesn't sound right, then place your attention into the fingertips of that hand and feel the frets.

What's Next?

Viewed very simply, the Bookmark System has only two parts —

1. Where is the playing field?
2. How do you move on this field?

1. The Playing Field is Nine Notes

We have now arrived at the point where you know the boundaries of the playing field. That is, the playing field for the Bookmark System is this pattern of only nine notes. Inside this pattern of nine notes you can operate.

This is most wonderful, in a way.

Because we've now established a way to begin with clarity. In other words, if you look at the instrument with no particular approach, you'll see that there are LOTS OF NOTES. Why, you can find the note 'A' over here and here and there and here and over here and there and here and here, and ... Well, you get the idea.

When there are too many freedoms, there is no structure!

More items than you can deal with constitute a *confusion*. This seems to be a universal human reality — When there are more things than you feel you can deal with, you feel confused.

The way to handle any confusion is to reduce the problem to a smaller number of items. How many? Why, a small number that you feel you can deal with!

Now here's a fact: For purposes of starting your learning on an 8-string bass or a megatar, there are just too many notes to start everywhere!

So you'll have to just start in *one* place.

There is no other way to do it.

So what have we done so far? We have reduced this confusion of notes and strings into just three strings and nine notes — and we've put the three strings and the nine notes under each of your hands.

Now you only need to think about a playing field which falls immediately under your two hands, and this field is identical in shape and meaning under each of your hands.

By this approach, we make the complex simple, so that you can begin.

Get it? Got it? Good!

Now the question of '*what notes to play*' has become very easy. We'll start our learning by playing these nine notes. Nine notes is much easier than hundreds of notes!

Isn't that great?

2. How to Move on the Field?

The alert student will have guessed that the next question must be '*how shall we play the nine notes*'?

And as you might imagine, now that we have a simple playing field, it will be fairly easy to start playing the notes.

If you are a bass-player, you know that the first way to think about notes is to play the 'Roots' of the chords.

For those of you who aren't bass-players and who don't know a root from a hole in the ground, here's the scoop —

You can have a song which drones on and on using only one note. But it's not a very interesting song. You have probably heard the toddler next door singing this song upon occasion, and most likely you had enjoyed it to the fullest long before he stopped singing.

Just about every song *does* have a central main note, around which the song moves. For example, when you hear somebody say a song has a 'key signature of C', what this boils down to is that the song is going to move around on various notes, but almost certainly it's going to end, and feel complete, on the note of C.

What songs generally do is play some notes based on the main note, then wander off for some other notes that are more jarring or seem somehow 'different,' and then return to the one main note that seems complete and final.

We apologize if this seems a little vague, but it's hard to accurately generalize because there are so many combinations of sounds which we humans seem to think are good. For example, young folks, think about polkas! For example, older folks, think about grunge rock!

For now, we are lucky because we do not have to write songs. For our purpose in learning, we can use songs which somebody else has graciously already written! How kind!

Further, wiser minds than ours have long noted that certain patterns appear over and over and over in our typical Western Music such as you will commonly hear in the USA or Europe.

And this means that we can start our learning by learning some patterns which aren't even as complicated as a song. Instead of initially working on a song which might have many 'chords' (stacks of notes) we can begin with a simple introductory exercise which involves only one chord.

Even when we go on to exercises that use two chords or four chords, or even when we go on to

songs which have lots of chords, as bass-players we can simplify these 'chords' (stacks of notes) down to the single lowest note in each stack of notes. And that lowest note is called the 'Root' of the chord.

We can work up exercises playing this Root.

After we can play this root pretty good, we'll naturally begin to think we are pretty slick, and just as naturally we will want to show off for our girlfriend and such.

Therefore we will then learn to play the other notes in the chord. Now in the Bookmark System, we will start out thinking of nearly all chords as having four notes. (The technical among you will realize we're saying that we'll start with 'seventh chords'.)

As a practical matter relating to learning, it just means that after you can play one note per chord, we can move on to playing four notes per chord.

After that, you can start playing the two hands differently. This can produce an amazing amount of variability and musical results. For example, your right hand might just play two harmony notes from the chord, while your left hand goes back to playing just the roots.

With nothing more than this, many hundreds of rhythmic possibilities arise.

And it goes on from there.

Here's how it works: the Bookmark System uses a Master Exercise, which consists initially of playing both hands identically, going up and down the four notes in the chord.

After you gain some skill, you can do this with several chords in a row, and it won't be long before you can select a different chord sequence every day. In this way you can move through the different keys, with your hands gaining more and more familiarity with the path.

By selecting just certain parts of the four chord notes, and by using rhythmic variations, we can create a vast variety of musically-useful patterns.

And because the Master Exercise consists of musically-useful patterns, you will be able to directly apply what you are learning in order to play songs. And that won't take too long, either, because at the simplest level, songs are only sequences of chords as well.

Next: Gold Record on the Wall

(Well, that could take a little longer.)

And now that you know the playing field of Nine Notes, we will next consider how to move on this field. Which brings us to the next section, the Bookmark System itself ...

The Bookmark System — Playing the Nine Notes

With Nine Notes, we Play Chords

We assume that you can now pick up the instrument, put it on, and locate the nine holy notes beneath each hand. We assume that you can play the nine notes from the bottom to the top, and are nearly always playing the correct note.

If not, please go back to last chapter.

If so, now we'll begin by playing a chord. It would be possible to start with scales and then handle chords, but we believe we can get you playing useful music faster by working on chords first, which will in time make the underlying scale obvious without even trying.

The Bookmark System will teach you to play the Seven Magic Chords, using the Nine Holy Notes. Then you'll be shown how to modify the seven magic chords to make the other chords you'll need.

You'll learn to play these chords with each hand, then you'll play the shape simultaneously with both hands, and then you'll learn to play part with one hand and part with the other, which opens the door to many rhythmic possibilities and unique 'Rhythm Bass' skill.

Why GM7?

Because it's relatively easy to play and convenient for us to describe. We've got to start somewhere, and this chord-form requires little finger stretch and the root is on the bottom.

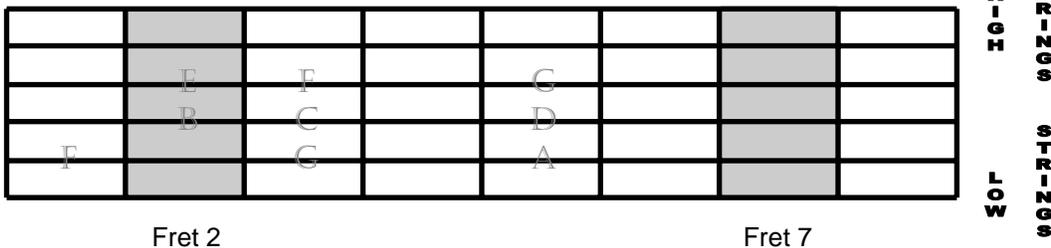

For those whose inquiring minds wish to know, the four notes of the GM7 chord are: G, B, D, and F-sharp, and last we'll play the G above which will sound complete. This will let us can play four notes up (G, B, D, F#), and then play four notes back down (High-G, F#, D, and B).

However, for this discussion and all through the Bookmark System, you won't have to think much about the names of notes in a chord. You will have to know the Root (bottom note), but whether or not you immediately know the names of the notes will not matter because you will know the shape to play, and things will work out fine.

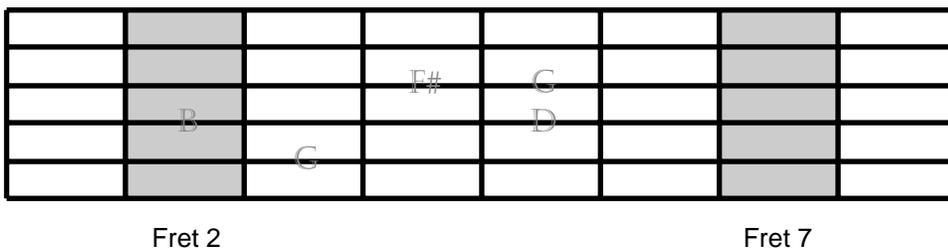

So let's take a look at the GM7 chord — We'll use Bass-Bottom Megatar for our example. 8-String is identical. If you're playing a Fifts-Bottom instrument, it's the same shape but lying upon the nine holy bass notes where they fall on your strings, so please adapt the graph to fall correctly on your particular instrument's strings.

We'll Start with One Chord — GM7

Bass-Bottom Megatar Fret 2 Position provides these Root Notes

Bass-Bottom Megatar — Notes of GM7 Chord on Bass Strings

Fingering the GM7 Chord

You'll notice that the two 'G' notes are shown in the fingering diagram as hollow. That's because G is the root of the GM7 chord, and we want to keep track of where the root is.

You'll notice that the lowest G is played with the second finger (shown by the bar symbol), and then you use the first finger (shown by the dot) to play the next note on the string above. (This next note is a B, and it is the 'third' of the chord.)

You'll notice that you use your third finger (shown by the triangle) to play the next note, which is on the same string. (This next note is the D, and it is the 'fifth' of the chord.)

You'll notice that you then go to the next string and use your second finger to play the F# (which is the 'seventh' of the chord), and lastly you use your third finger to play the top G, which is the root of the chord, but because it's at the top of the chord, normally we would call it 'the octave.'

Please try playing this shape.

Strict Fingering, Please

Those of you who are already bass players almost certainly already know this shape and how to play it. However, be aware!

Please use strict fingering to play this shape.

Some bass-players would tend to play the D note with the little finger, mainly just because it's there, and there is also a school of playing that recommends placing one finger at each fret.

But we have that D played with your third finger, because this system uses three fingers on each string for three notes on each string, and saves the little finger for a few special cases.

So for now, please use strict fingering as shown.

Strict fingering is going to pay off for you later. Remember, this system is called the Bookmark System because it enables you to easily keep your place. If you finger it any old way, it will go to hell fast and won't help you at all.

So for now, please finger it exactly as shown. Later, when you've learned the system, if you want to change it, feel free!

Go Slow

If you are new to this instrument, you may have to go very slowly. Too damn bad. That's where you are, so that's exactly where you should begin!

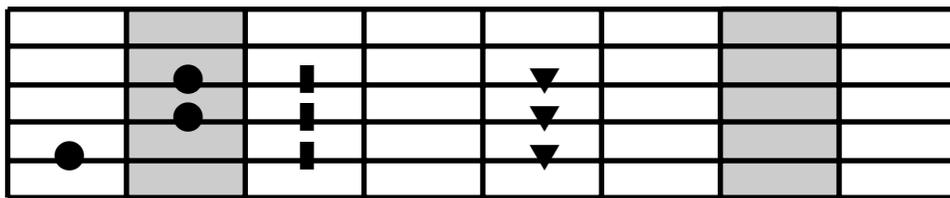

In any event, however, *do not play faster than you can play correct and clean-sounding notes!* Regardless of your skill level, you should not practice wrong notes or bad notes. If you practice bad notes and dirty notes, you will then play bad notes and dirty notes because you've trained yourself to play them!

Only Perfect Practice Makes Perfect

The old saying that Practice Makes Perfect is not quite right.

What is really true is that only *Perfect Practice Makes Perfect*. In other words, you're just teach-

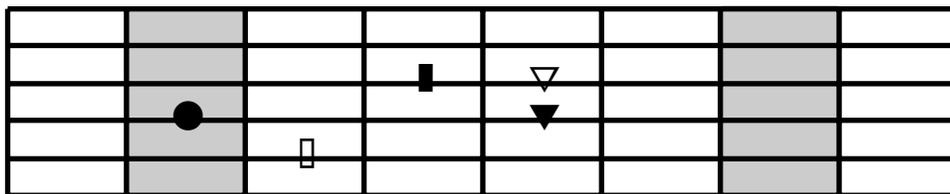

Bass-Bottom Megatar — Fingering The Nine Holy Notes

- Root = Hollow

ing your fingers to tread a certain path. The more they tread the correct path, the more able they become in treading the correct path. But if you let them tread the incorrect path, they are learning to tread the wrong path, which isn't what you want.

Rules of Thumb —

- Only play the exercises as fast as you can execute the notes correctly and cleanly, no faster.
- A good guideline is that you should be able to get 85-90% or more of the notes correct each time through. If you're hitting less than that, your running through fast is teaching your hands the wrong thing — *so slow down!*
- When you have nearly completed the exercise, be sure to end on a good one. If you do a poor one, do another and get it right and then stop. It will feel better.

Practice 'Open and Closed'

There is a great book for high-school drummers learning the 'rudimental' style of snare-drumming. It's a sort of crisp, military sound such as you hear in John Phillip Sousa marches. The book for snare drummers is called 'Stone's Stick Control' and it consists of endless measures of eighth notes, but different combinations of using the left stick or the right stick.

While we promise not to present you with endless measures of eighth notes, there's a great technique given in that book for gaining playing proficiency. It is called 'Opening and Closing.'

Playing an exercise Open and Closed means that you start as slow as molasses, and then you *very very slowly increase your speed* until you attain the fastest you can play without errors flourishing, and then you *very very slowly decrease your speed* back down to the snail's pace.

Posture Matters

While you are doing this, pay particular attention during the slow movements to your whole body. Your posture should be erect and balanced, your arms in correct playing position, and your muscles should not be especially tight.

It may be helpful to imagine that the movement to play the note is actually coming from your arm

and wrist, and not only by finger movement.

Your Thumb Doesn't Move

Your thumb should basically stay in one place on the rear of the neck. The thumb may sort of roll as you stretch the fingers forward or back upon the fretboard, but the thumb should not slide around. That is, you should *not* be moving your hand with each note.

This doesn't mean your arm or thumb or wrist should be rigid or uncomfortable. It just means — don't move your hand around. Your fingers *have* to move around, but in this exercise your thumb doesn't have to move, so let it stay in one place and you'll have a nice sense of where your hand is, and that's a good thing.

Play by Touch, not Vision

While you are initially working out the exercise, it's OK to pull the fretboard back against your chest to peek at the fretboard, but then use your left thumb to press the fretboard upright and away from your body, so that you're looking at the back of the neck. Your head should be erect.

Because we are primates with hundreds of thousands of years of danger teaching us to look out!, we have an automatic tendency to use our most reliable sense which for most of us is our vision. (To *see* a tiger across the forest is much better survival than to wait till we can *feel* its fur!)

But although vision is great for lots of things, it is not the best way to play. For example, touch is a much more accurate sense to use.

However, while you are learning, you might feel uncertain or you might play a note wrong and you don't know how that happened. And in that case you will be very tempted to peek.

But realize that peeking is teaching yourself to use your eyes to play, and *that's a lousy way to play!*

For one thing, it's slow.

For another, it won't work on a dark stage.

For another, you can't read your music.

For another, you can't look at the audience.

For another, you'll never notice the cute groupie over in the corner winking at you.

So peek to figure out what you're doing, and then do the exercise *by touch!* After all, this style is called *Touch-Style!*

For those of you who are impatient by nature, this will build your character in a hurry, because it will make you go slower in the beginning. However, learn it correctly, and you can fly later.

Play On the Fret

Your left-hand fingertips should be striking the string gently, and not in the space between the frets but actually ON the fret. Most of your fingertip will be behind the fret, but you should be able to *feel* the fret beneath your fingertip.

Striking on the fret gives you the best tone, and also avoids sharpening the note by accident. If you allow yourself to strike the string between the frets, your striking finger can actually stretch the string, which bends the pitch up.

Striking directly on the fret sounds the best, and it's the most precision playing, and there's a big plus in that you get feedback. That is, when you're playing on the fret, your fingertip can tell you when you're off-position, and you can correct.

There is no such handy information when you're hitting the string just any old place between the frets. So play on the fret.

To get this for yourself, just experiment with your amp set clean, and listen carefully to the tone and the stability of the pitch of the played note.

Got a Metronome?

When you're first working this out, you may be going very very slowly. And initially you'll get some good results playing 'Open and Closed.'

But after some practice you will be able to play up and down the chord notes smoothly and at a reasonable and musical sounding tempo. As soon

as you are playing in any sort of regular rhythm, try using a metronome and begin to concentrate on playing exactly on the beat.

Remember — any good bass player will tell you that it's not how many notes you can play, but instead it's playing the *right* note, and playing it at exactly the *right time*.

So don't be in too much of a hurry to play the pattern real fast. What is more important is that you play it with perfect rhythm, at whatever speed you can play correctly.

Slow and Legato

Very soon we'll get to playing notes with syncopation to make things more interesting, but initially play them very boring — right on the beat and holding the note out for the full duration.

How Long, O Lord?

This first time, you might have to spend some time getting it right, but basically you're ready for the next step when you can play this one chord up and down in a steady rhythm — without looking, without missing notes, and with good posture.

Attaining this level of proficiency might be slow, or it might just take a few minutes. It depends upon your skills and old experience.

When you can do that, let's try the right hand on the melody strings ...

Playing GM7 on Melody Strings

Does the graph below look, somehow, familiar?
By Golly, it's exactly the same as the bass hand!
Wow! Is that lucky, or what?

Three Types of People

In the field of Neuro-Linguistic Programming, sometimes just called 'NLP', the gurus say that most folks have a favorite sense, and that folks use this most-trusted sense as their model inside their minds for how they see the world and figure things out.

The vast majority of us use vision as the most effortless way to 'model' things inside our head. That is, most of us find it easiest to 'view' or 'see how things look' inside our head as a way to figure out the world.

Even though musicians deal with auditory things, less of us use audition as the most effortless model inside the head, and even fewer use the tactile sense (touch) as the primary mental model.

Whether or not the NLP gurus are correct, it's an observable fact that if you can picture the shape of the chord, then you can 'see' your fingers playing it, even if your eyes are looking at the back of the instrument's neck (as they should be!).

Try it and you'll 'see'.

One Hand Teaches the Other!

Oddly enough, you will discover that when one hand has learned how to do something, the other hand almost knows already! Meaning that teaching your left hand to play this identical pattern on the bass strings somehow magically reduces the time required for your right hand to learn it.

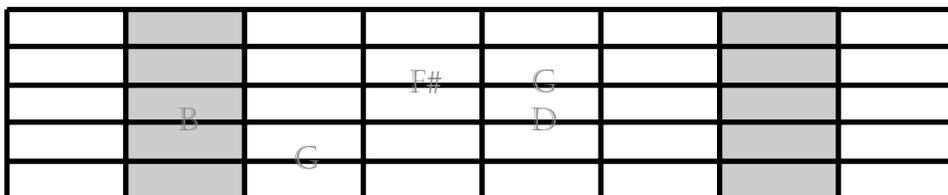

And so your next task is to play the GM7 chord notes with your right hand on the Melody strings.

Please use the same recommendations from the previous pages about keeping correct posture, relaxed muscles, thumb in one place on the rear of the neck, head upright, and using the fingers to 'feel' the notes rather than looking at the keyboard. (But of course, a quick peek to initially place your fingers is fine.)

Rules of Thumb —

- Use VISION to picture the chord shape in your mind, but
- Use TOUCH to feel where the notes are and to play them, and
- Use EARS to hear how well you're succeeding!

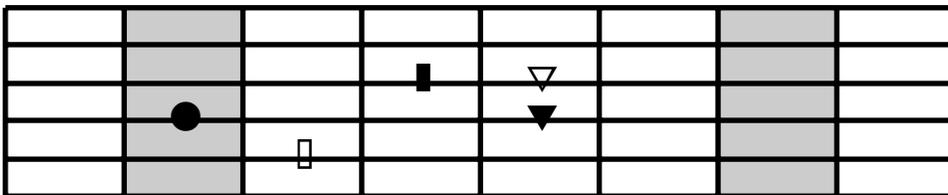

Bass-Bottom Megatar — GM7 on the Melody Strings

- 4 = X
- Root = Hollow

Bass-Bottom Megatar is shown as our example. A Fifths-Bottom instrument has identical *melody* strings. Playing 8-String Bass? Adapt the graph to the correct position on your instrument.

Playing GM7 with Both Hands

You may have to start slow, but many of you are going to be very surprised how amazingly easy it is to play the same chord with both hands.

We've placed graphs below showing the fingering for both bass and melody notes. We've used the Bass-Bottom Megatar as our example.

(This means that players of Fifths-Bottom instruments will need to adapt the graph to the correct position on their instrument.)

Start Slow, and Play by Touch ...

- After initially peeking at the fretboard to place the second finger of each hand on the initial 'G' note, try tapping both second fingers at the same time. Both are playing the 'G' note shown on the graphs below as the lowest note.

(Note to players of Fifths-Bottom instruments — with your bass hand, you'll be actually playing the *highest*-pitched G, but that's fine. For our discussion we'll refer to it as 'Low G' as it's the lowest positioned on the graph printed on this page. Your instrument will sound a bit unusual as you play both hands together, but that's OK as well, because the method will still take you where you need to go.)

- When you can tap the two Low-G notes at the same time, feel with your left hand first finger for the lowest-pitched note on the next string — as per the graph. (It's the note 'B'.)

Then feel with your right hand first finger for the lowest-pitched note ('B') on the next string — as shown on the graph.

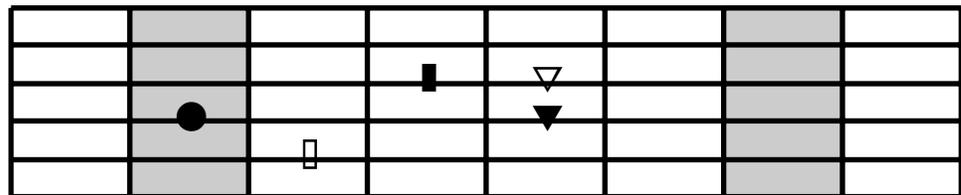

- Now with both first fingers, tap simultaneously on this second chord note. Both fingers will be tapping on a 'B', and your ears will tell you that they're playing the same note. Before you go on, go back to tapping both second fingers on the Low-G note, then repeat tapping both first fingers on the B-note.
- Now try tapping 1-2-3-4 on the Low-G with second finger, and then tapping 1-2-3-4 on the B-note with first finger. Back & forth.
- When you can do this comfortably, try going from the B-note to the third chord note which is a D-note, played with the third finger of each hand as shown on the graph.
- Then try playing 1-2-3-4 on G, then 1-2-3-4 on B, then 1-2-3-4 on D, then 1-2-3-4 on B, and repeat, using the fingering just as shown.
- When you can do this, add the F# note on the next string using your second fingers. Up & down.
- When you can do this, add the final High-G on the top of the graph, and now you can play up and down the entire chord. (Fifths-Bottom instrument guys, the bass G on the 'top' of the bass graph is actually your lowest-pitched G, but that's OK.)

Congratulations!

You are playing the GM7 chord note by note.

You are also playing simultaneously with both hands — something most bass players cannot do!

Let's Try Two Chords!

If you can play the GM7 chord up and down in a steady tempo with nearly all the notes sounding OK, then we'll try our first 'Chord Progression.'

Actually, it doesn't seem right to call this a 'Progression' because it doesn't have much sense of going someplace. It changes, but doesn't much 'arrive.'

So without going into much theory, let's just refer to this two-chord thing as a 'Chord Alternation.'

For this next step in developing the Master Exercise, we're going to alternate between two chords, first the GM7 chord that you know, and then the C Major Seven chord.

Learning the CM7 Chord

As you can imagine, our next step is to learn the CM7 Chord. Therefore, we've shown it below.

We've again used the Bass-Bottom Megatar as our example. 8-String Bass players will have to place the melody notes differently on their neck. Fifths-Bottom instruments will have to place the bass notes differently on their neck, but the pattern will be played and fingered exactly the same.

What? The Root's in the Middle!

As you look at the graph, you'll notice that the hollow symbol which indicates the root of the chord is not located at the bottom of the graph.

Here is our first consequence of choosing to

play *in one place*. The Root of any 'C' chord is the note 'C', which just doesn't happen to occur on the lowest string in the area of our nine chosen notes. And therefore we're going to have to play that 'C' where it *does* occur, which is on the middle of the three strings which we are using.

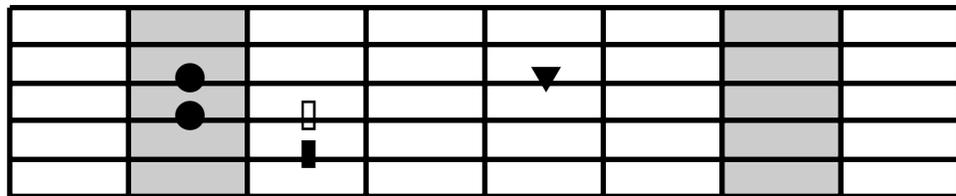

Does this matter?

Not really. When you play this pattern up and down from the lowest string to the highest string, it will have a different character than the GM7, but for our learning purposes, and for most musical applications it will work fine. Later on, when you take up "Moving Chords" you might just move the entire GM7 shape to a different three strings to get the same sound. In fact, for most musicians that 'moving' approach is usually more intuitive and apparent. But for now, we're not learning a Moving System, we're using a Fixed System, which will pay big dividends in your rapid learning to play with musical results.

So you still play the pattern with fingering as shown on the graph. You may have to feel the individual notes and go slowly as you did when learning GM7 but your goal is the same — to smoothly play 1-2-3-4 up and then 1-2-3-4 down.

To be specific, your first note is second finger on lowest-graphed string (the note is 'G' which is the 'fifth' of the CM7 chord). Your second note is first finger on second string (playing 'B' which is the 'seventh' of the CM7 chord). Your third note is second finger on same string (playing 'C' the root of CM7 chord). Your next note is first finger on next string (playing 'E' which is the 'third' of CM7 chord). Your highest note is third finger on same string (playing 'G' again which is the 'fifth' of CM7 chord).

Observe — the Shapes are Different!

The alert student will have noticed that the Shape of the GM7 is different from the Shape of the CM7.

This is an important and handy fact about the Bookmark System.

You will remember that, using the Nine Notes in one position, we are going to learn Seven Chords. Right now we'll tell you that the Seven Chords we're going to learn are — AM7, BM7, CM7, DM7, EM7, FM7, and GM7.

And your first important fact about these seven chords is that *every one of them has a different and very distinctive shape* when played on our nine notes.

So you will learn, in an easy manner, these seven chords one at a time. And in a short time you can play any of these seven chords and its shape will be obvious to you.

This will not be difficult. There are only seven of them to learn!

Now here's the really wonderful part ...

Once you know a chord's distinctive shape, you can slightly modify it to create other chords you'll need. For example, from CM7 you can move one note to get C7. Move one more note to get C minor 7. And move one more note to get C minor 7 flat 5. And what's really great is that, the chord still keeps its distinctive shape as compared to the other chords.

Can You Describe the Shapes?

As a way to help you recognize the chord by shape, let's describe the shape. We might call the

GM7 shape a 'diamond'

But what would we call the CM7 shape?

What would *you* call it?

Try Alternating GM7 and CM7

Once you can play the CM7 chord tones up and down, try playing the two chords in alternation — first the GM7 (several times), and then the CM7 (several times), then back to GM7 (several times), and repeat.

You will discover that you'll make less errors and thus produce better finger-training if you play each chord several times before changing to the other. It allows your fingers to 'groove in' to the shape and the motion.

If, early on, you attempt to play the GM7 once and then the CM7 once, and back and forth like that, unless you are already very skilled, you will see your errors multiply and your sense of certainty diminish.

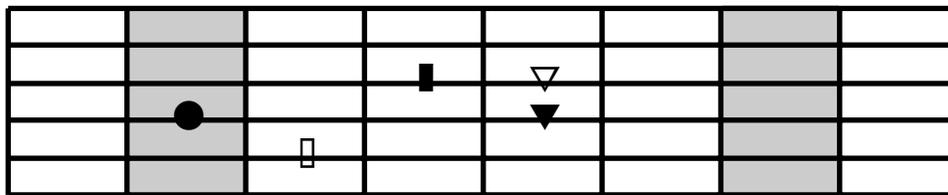

So the question is: How many times to play each chord before switching?

The answer is: Find the lowest number of times on each chord which keeps your errors low.

For example, you might play GM7 up and down four times, and then CM7 up and down four times. Then when you can do this smoothly without errors, try playing GM7 up and down twice and then CM7 up and down twice.

Eventually you'll be able to play GM7 up and down once, then CM7 up and down once, and repeat. But practice this way only when you can do it without errors. If you start getting more errors, then back up to more repetitions of each chord.

One Hand and then Two Hands

You've probably already worked it out for yourself, but in doing the GM7-CM7 alternation you will probably try it first with your left hand on bass notes, and then try it right hand on melody notes, and then both hands together.

As always, go as slow as needed so that your hands and fingers feel comfortable, and you have a feeling of calm doing the exercise. Your fingers and hands, not your head, will tell you how fast to go with this feeling of comfortable certainty.

Right on! And Left on, too!

What Are these Chords?

The technical among you already know the answer but any newcomer may be asking why we combine these two particular chords.

Here's the scoop —

Assuming for a moment that we are playing a song 'in the key of G'. Or we might say that we're playing a song 'with a key-center of G.'

These phrases mean that we're playing a song (or part of a song) where the main note is G, and we'll play some other notes and chords which sound more jarring or somehow different and then we'll tend to come back to the G and it will sound somewhat complete and final.

If we are in the key of G, then we are generally playing in the 'Major Scale' of G. Which means that when we play up and down the seven notes G, A, B, C, D, E, F#, and G that it will sound correct, and it will sound like it goes with the GM7 chord.

In that scheme of things you'll notice that C is the fourth scale note, and therefore the chord built upon C with a C-Root is a 'Fourth Chord'.

Now it happens that if you build a chord on C, using only the scale notes in our key-center of G,

you just so happen to come up with a C Major Seven chord. (If you cannot immediately see why that's true, don't be concerned as this will all be handled more fully later on.)

Now by playing GM7 which is ON the key center, and then playing CM7 which we might describe as 'floating OFF' the key center, you get a sense of motion.

This particular motion doesn't seem to much arrive at anywhere, and it's not a 'satisfying' type of motion, but we'll learn more satisfying chord movements later.

For right now, this is a very simple chord alternation which for most folks will feel like being ON, and then floating OFF and then being ON, and then floating OFF, and so on.

It's a 'One - Four' Alternation

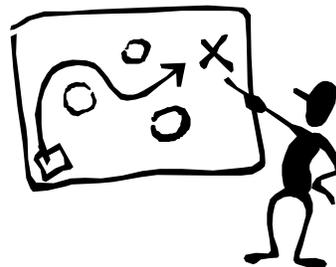

Technically, you are playing the One Major Seven chord (GM7), and the Four Major Seven Chord (CM7). The correct technical shorthand notation for this is using roman numerals thus:

IM7 — IVM7 — IM7 — IVM7, etc

When we go on to play in other keys, although the notes will change and the chord names will change, when you play in any key the IM7 and then the IVM7 back and forth it will have this same ON — floating OFF — ON — floating OFF feeling to the alternation.

In a similar fashion, when we go on to more complicated 'chord progressions', each progression has a certain feeling of tension and resolution to your ear, even if you're playing the same sequence in a different key center.

And for you, you technical dude, just keep on practicing your IM7-IVM7 alternation till you're smooth at it.

Let's Try Another Chord-Pair

The IM7-IVM7 progression can also be referred to as the I-IV progression for our purposes here.

Since you have mastered playing the I-IV progression in the key-center of G, using the GM7 one-chord and the CM7 four-chord, the next step is to play the same I-IV alternation in another key center.

We could just pick any old key center and work out what the I-chord and the IV-chord are, but let's make it easy on ourselves by choosing our next key center so that we only have to learn one new chord for the next step.

We'll have a choice of two new key-centers. Either one will only require us to learn one new chord.

For example, we could choose the key of D, and then the DM7 chord would be the I-chord, and our old familiar GM7 chord would be the IV-chord in that key. And then we could play DM7—GM7 back and forth for the I-IV alternation in the key of D.

Or for example, we could choose the key of C, and now the CM7 chord which we know would become the I-chord in the key of C. Then we'd learn a new FM7 chord to be the IV-chord.

And that's the one we'll choose next.

The key-center of C is easy to study because it has no sharps nor flats. In fact, the Nine Holy Notes are technically in the key of C because none of the nine notes as originally given have any sharps or flats.

Back when we were playing in the key-center of G, we sharpened the F note because in fact the key of G does have one sharp and that one sharp is F#.

Sharpening that F-note in the key of G is required to make playing a scale up from G sound correct as a 'major scale.' (If this is news to you, it's OK if you don't yet know all the rules and regulations for keys and sharps and flats, because all this will become clear as you progress in your learning.)

But now that we're going to go to the key of C, there will be no sharps nor flats.

The 'major scale' for the key of C therefore consists of the notes of C, D, E, F, G, A, B and C.

Pretty simple.

Also, it's pretty simple to see that the fourth note in this scale is the note F.

That means that the IV-chord will be F-chord.

Since we know that, in a major scale, the IV-chord is a Major Seven chord, then we know that the F-chord is going to be FM7.

An Insider's Tip

We'll now let you in on a little secret ...

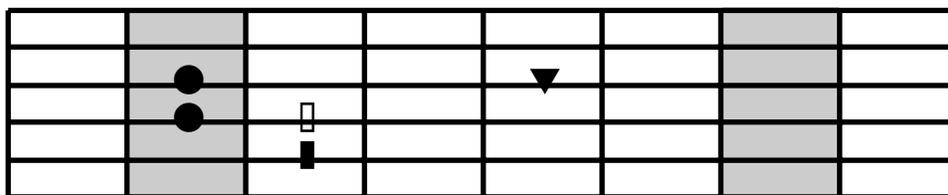

The reason we are initially presenting the I-IV alternation around the keys is that it means that you only initially have to learn the Major Seven chords. (You don't have to initially bother with 'Dominant Seven' or 'Minor Seven' or 'Minor Seven Flat Five' chords — isn't that great!)

Now there are only seven 'Major Seventh' chords, not because they're called 'Seventh' chords but because there are only seven named notes: A, B, C, D, E, F, and G.

Now if you would be so kind, please learn the FM7 chord with fingering shown below, and then learn the CM7—FM7 alternation.

Once that's done, you will only have four Major Seventh chords left to learn!

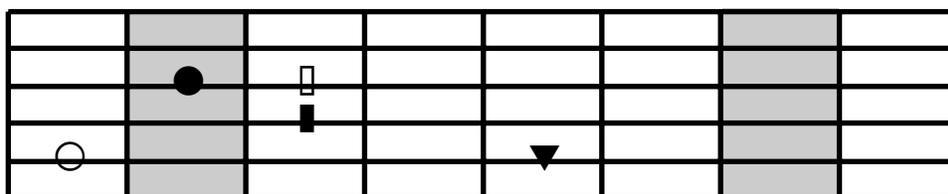

Bass-Bottom Megatar — Left-Hand CM7 (IM7 in C)

- 3 = down triangle
- 4 = X
- Root = Hollow

Learn all Seven Major-7 chords

We will now present all seven 'Major Seventh' chord shapes. For right now we don't care much about the names of the notes. All we care about is —

1. The shape of the chord form,
2. The fingering of the chord-form, and
3. Which note is the Root.

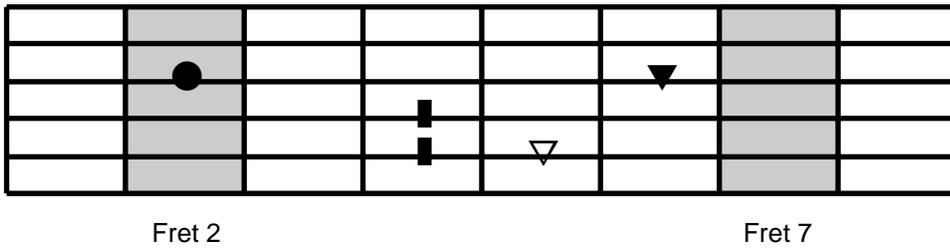

Our chart makes it easy. The shape is shown.

The fingering is shown. The Root is shown.

As before, our example will be Bass-Bottom Megatar, and showing only the bass strings (because the pattern and fingering is identically shaped on the melody strings). As before, folks playing 8-String Bass or Fifths-Bottom instruments please play the identical note fingering upon the Nine Holy Notes as they fall upon the neck of your instrument.

Here they are —

What Patterns do you see?

Do you see how the Root moves up, as you go from AM7 to BM7 to CM7 to DM7 to EM7 to FM7, to GM7, and finally up to AM7 again?

Do any of the pattern-shapes suggest a description to you? For example, we think the B-shape is like a 'Hill', and we think the E-Shape is a 'Cup'.

Please examine the chord shapes thoughtfully and see if any of these shapes suggest an obvious

description of the shape. If so, please pencil the descriptive word near the graph. The descriptive word will help you initially remember that the BM7 is the 'hill-shaped one,' and so on.

Next, going slowly and carefully and using the fingering as given, please try fingering these different chord shapes, just to gain some familiarity with them.

Next, we'll make some I-IV Alternations into the first version of your Master Exercise ...

The Almost Master Exercise, part one

Below you'll see a table which expresses in a very compact form the most common I-IV alternations. There are a few others, using sharps and flats, but this short list is just to familiarize you and so we were able to avoid all the sharps and flats except that you'll have to play BbM7 on one of them.

So it raises a question: You have a chart for playing BM7 but how do you play BbM7?

And the answer is: Play BM7 with all of your

fingers moved one fret toward the tuners! Played in place as shown on the graph it's BM7. Played one fret toward the tuners (or you could say with all the notes flat), it's BbM7.

Now please learn to play the following seven I-IV Alternations. As before, as needed learn each hand, then play both hands simultaneously, legato and only as fast as avoids errors. Play them Open and Closed, and then at a moderate tempo.

After you learn these, we'll add the flat ones.

	IM7	IM7	IVM7	IVM7
(key of A)	AM7	AM7	DM7	DM7
(key of D)	DM7	DM7	GM7	GM7
(key of G)	GM7	GM7	CM7	CM7
(key of C)	CM7	CM7	FM7	FM7
(key of F)	FM7	FM7	BbM7	BbM7
(key of B)	BM7	BM7	EM7	EM7
(key of E)	EM7	EM7	AM7	AM7

The Almost Master Exercise, part two

Below you'll see a table very much like the last one, but arranged a little differently, and it's longer.

This here is the *real* table.

This table has the I-IV Alternations listed in a different order, and there are more of them.

This different order is, as you will see, just a case of dropping one whole step on each succeeding exercise. As you'll see, dropping a whole step from C gives you Bb, and dropping a whole step from Bb gives you Ab, and dropping a whole step from Ab gives you Gb, and dropping a whole step from Gb gives you F, and dropping a whole step from F gives you E, and if you dropped a whole step from E it would bring you

back to C.

As it turns out, those six keys are about half of all possible keys. The other keys are listed in the second part of the table, and these exercises drop a whole step starting from G, down through F, Eb, Db, B, A, and back to G.

There are no sharp chords in this exercise. Of course, some sharp chords do appear in music, but because of the way horns (like trumpets and saxophones) work, the flat keys are a little more popular. That is, you will see folks play in Bb a lot more often than in the identical-sounding A# key.

So for now, just count yourself lucky that you only have flat chords to deal with, and as on the previous exercise, to play a flat chord just play the equivalent 'natural' chord one fret lower

	IM7	IM7	IVM7	IVM7
	CM7	CM7	FM7	FM7
	BbM7	BbM7	EbM7	EbM7
	AbM7	AbM7	DbM7	DbM7
	GbM7	GbM7	CbM7	CbM7
	EM7	EM7	AM7	AM7
	DM7	DM7	GM7	GM7
	_____	_____	_____	_____
	GM7	GM7	CM7	CM7
	FM7	FM7	BbM7	BbM7
	EbM7	EbM7	AbM7	AbM7
	DbM7	DbM7	GbM7	GbM7
	BM7	BM7	EM7	EM7
	AM7	AM7	DM7	DM7

The Oddity of CbM7 ...

The astute student will have noticed the 'CbM7' on the fourth line and pondered the fact that since Cb would be the same note as 'B' then a CbM7 would have to contain the same notes as a BM7.

And you are correct. However, do not substitute a BM7 in the exercise. Here's why —

You are training your hands to operate automatically and with precision. And what is going to happen as you are reading music in that key of Gb is that the scale contains the notes Gb,

Ab, Bb, Cb, Db, Eb, F, and Gb. To list the notes any other way would require that two notes would have the same letter name (such as for example Bb for the third note and B for the fourth note). This is forbidden in music notation. It's considered less confusing to have a chord called CbM7.

Who are we to gainsay the gurus of Music Theory? So just play it as CbM7, meaning the CM7 shape moved one fret lower toward the tuners.

The Secret Mystery (Shhh!)

Hidden in the preceding chart (but not very hidden) are a couple of patterns, but as a special treat we'll not spill the beans here.

Some people like puzzles, so we'll leave the puzzle of the Twice-As-Long chart to those folks who like puzzles, as a kind of bonus or special treat.

To see the interesting puzzle, on the first half of the chart please just read all the chord symbols in turn: CM7, FM7, BbM7, EbM7, and so on.

Then try the same thing on the second half of the chart.

Any similarity?

Any difference?

Now, why?

(If this makes no sense to you, or if you just don't give a damn, that's OK too, as this is just for people interested in music theory and puzzles.)

Why the 'Almost Master Exercise'?

The preceding chart is not quite the Master Exercise, but we only need one missing part to get to the real Master Exercise.

The main problem is that these 'Alternations' just don't cut it as a 'Chord Progression' because there's only a slight sense of progression.

To cut the suspense short, we'll just tell you.

What we need is a good old Dominant 7 chord, which is often just called a plain 'seventh chord.'

So you can hear what's missing, please play the following sequence:

GM7— CM7— GM7— DM7

It sounds *kind* of interesting, and *kind* of right, but not quite. When you hit the DM7, doesn't it sound like you suddenly went around a corner or zoomed to the left somehow? Doesn't the DM7 sound 'sort of not right?'

We think it does. Most musicians would think it sounds somehow wrong.

But we can fix that.

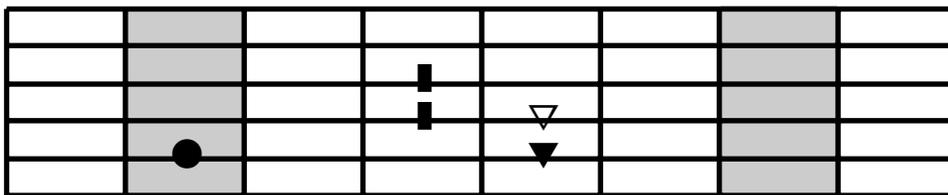

Take a look at the graph below for a 'D7' chord. You'll notice that only one note is different from the 'DM7' chord. In the DM7 there is a C# note, and in the D7 note you find a C-natural instead.

Try playing the D7, and then try playing the following sequence:

GM7— CM7— GM7— D7

We think you'll agree that it sounds more 'right.' Now can you think of any reason that might be true?

Bass-Bottom Megatar — Left-Hand DM7

Fret 7

This is a "Major Seventh" Chord

Bass-Bottom Megatar — Left-Hand D7

Fret 2

Fret 7

This is a "Seventh" Chord

The Mystery of the D7 Chord

On the first chart below, we've marked the notes of all three chords GM7, CM7, and D7. The notes that are part of the GM7 chord we've marked with a □.

The notes that form CM7 we've marked with a ◆. And the notes that form D7 we've marked with a ☺.

Notice how many fall on the same notes. The A note only occurs in the D7-chord, and the E-note only occurs in the CM7-chord, but all the other notes occur in at least two of the three chords.

Play the notes below.

Holy cow! It's a G Major scale!

But of course!

The GM7 is the I-chord, the CM7 is the IV-chord, and the D7 is the V-chord. The V chord must be a V7 to fit the scale.

Do you see that the C# of DM7 didn't fit?

That's why D7 sounds 'right' and DM7 doesn't.

You can See the Scale in the Chords

A few pages back, we mentioned that it would be possible to study scales first and then extract chords from the scales, but that we thought it best to study chords first because along the way you'd be able to see the scale without even trying.

Perhaps you can see what we mean.

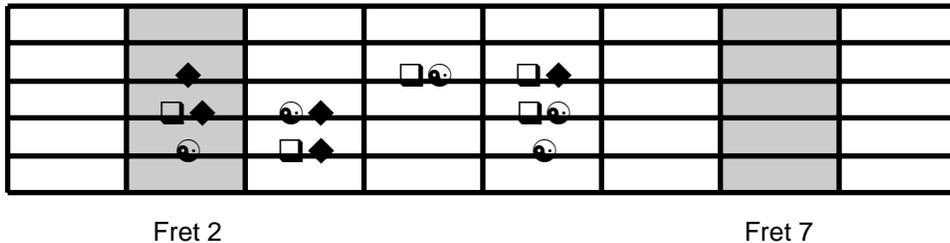

When you play a simple chord progression such as I— IV— I— V, just by observing which notes have been played, you can *see* the shape of the scale that goes with the I-chord.

In this example, you played GM7— CM7 — GM7 — D7 and could then *automatically see* the scale notes of G.

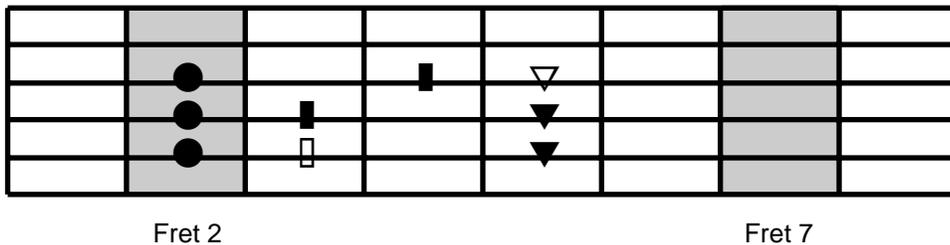

We're not going to use this fact much at present.

What we're really interested in is that we need to learn the plain 'Seventh Chords', also called 'Dominant Seventh Chords', so that we can play more interesting chord progressions.

Megatar — Left-Hand GM7(□), CM7(◆), & D7(☺) Notes

Bass-Bottom Megatar — the G Major scale

How Chords are Built

We think that the easiest way to actually ‘see’ scales and chords is to look at a piano keyboard. If you look at a keyboard, and just pay attention to the white keys, you will see that they’re laid out in a very simple system —

A— B— C— D— E— F— G

To make a simple chord you’d start on some white note and play every other white note, such as A, C, E, and G. However, because there’s no black key between B and C, nor between E and F, it makes these various ‘white note’ chords have different types of sounds, though we aren’t going to get into that just now.

However, we can certainly use the simple image of a piano keyboard, and playing every other white key to explain how the chord tones are named.

Let’s pretend you were starting on the note ‘D’, and you call the D-note the ‘one’ of the scale. Then the E would be the second note, and the ‘F’ would be the ‘third’ note.

The G would be the fourth note, and the ‘A’ would be the ‘fifth’ note.

The B would be the sixth note, and the ‘C’ would be the ‘seventh’ note.

All right. Now let’s just take every other note to spell out a chord. We’ll illustrate this from the bottom up. This is the conventional way to do it because it models the way we notate notes on the treble and bass clefs in music. So our chord would look like this —

- C the ‘seventh’ of the chord
- A the ‘fifth’ of the chord
- F the ‘third’ of the chord
- D the one (or ‘root’) of the chord

We know this is *some sort* of D chord with a seventh. In fact, just as it happens to fall on the white piano keys, it would be a ‘D Minor Seventh,’ but if we just make the F into an F#, this chord would become the very D7 we’ve been talking about.

The Difference between DM7 and D7

What is the difference between these two chords? You can see from the chart that the DM7 has a C# note, and the D7 has a C-natural note.

You can see on the graph that the C# or the C-natural is the note just below the Root of D. This means that the C# or the C-natural is the ‘seventh’ of the chord.

So the difference between DM7 and D7 is that DM7 has a seventh which is only one half-step (one fret) lower than D. This kind of seventh is called a ‘Major Seventh’ and we can handily call the DM7 chord a ‘D Major Seventh’ chord.

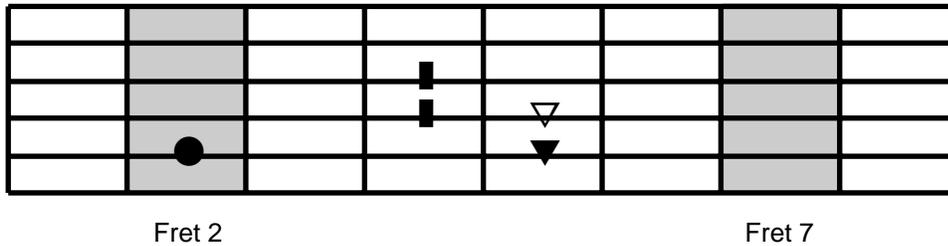

In the D7 chord we have a seventh which is *two* half-steps (two frets) below the D, or you can say it’s a *whole-step* below the D. This kind of seventh is called a ‘Dominant Seventh’ or just a ‘Seven’, and that’s why we call the D7 chord a ‘D Seven Chord.’

If you had been playing in the key of D Major, then the DM7 would have been your I-chord and the Major Seventh would fit in. But in the key of G, the D-chord is the five-chord, and must be a D7 in order to fit in the G Major scale.

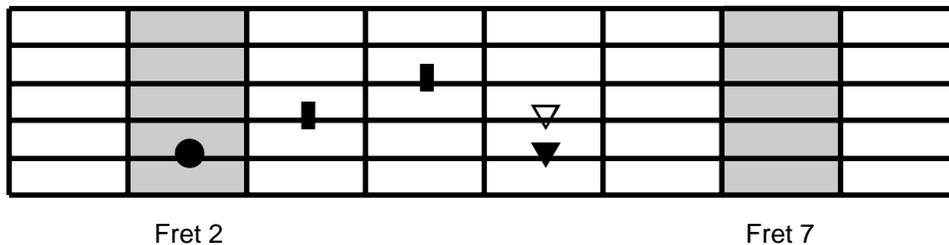

We haven’t really fully explained the why of all this, but you can see that it’s true.

It’s got to be D7 to fit. And when you play it that way, it sounds right.

Bass-Bottom Megatar — Left-Hand DM7

Making Dominant-Seventh Chords from Major-Seventh Chords

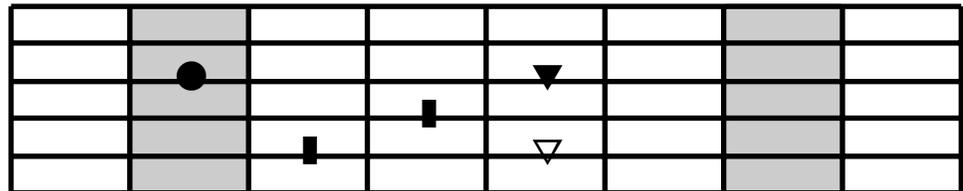

Before we give you the complete set of Dominant Seven chords (or just 'Seven Chords'), please go back to the two pages where all the Major Seventh chords are given.

Then see how easy it is to make Seven Chords from Major-Seven Chords —

1. Find the root, and then
2. Find the next lower-pitched note below the root, which has *got to be* the seventh of the chord. Since it's a "Major Seven" chord, the seventh should be just one half-step below the root. And then
3. Very lightly just pencil the seventh one half-step (one fret) lower, and after you've done this with all of the Major Seven chords then
4. Compare your penciled solutions with the Dominant Seven Chords as we present them here ...

You'll notice on the first chord, that *two* notes move. That's because the seventh of the chord appears *twice* in this chord shape.

Learning the Seven Chords

Now you have the seven Dominant Seventh or Seven Chords. Familiarize your fingers with them. A good way to do that is to play the Major Seven and then the Seven Chord, like this —

GM7 — G7 — GM7 — G7 etc

As surely you can imagine by now, you try this with your left hand, then with your right hand,

and then try it with both hands simultaneously. And just like any exercise, play by touch, go slow at first, make sure nearly all notes are correct and if there are lots of errors then slow down. Keep good posture and feel the frets beneath your fingertips, which should be playing ON the frets.

When you've familiarized yourself with the Seventh Chords, we'll work them into the Master Exercise, which is next.

The Master Exercise, Part One

In its simplest form, the Master Exercise consists of one Chord Progression, and the Chords consist of arpeggiated notes done simultaneously with both hands.

When you can do the arpeggiation with both hands easily, you use rhythmic variations in your right and left hand, and thus generate many musical ways to play what we call Rhythm Bass.

In addition, the Master Exercise sets the stage for improvising solos, doing walking bass, and other musically-useful techniques.

The first Master Exercise sequence is given

concisely in the table below. This Chord Progression we call the 'Folk Cycle' because you can find it occurring in a number of Folk Songs.

Try this exercise in the usual way. First one hand, then the other, then both hands simultaneously arpeggiating the chords up and down, and moving through the progression in a rhythmic manner.

Slow at first, then up to the speed where you can avoid nearly all errors. Repeat each chord multiple times as needed to get smooth.

Smooth and rhythmic is important. Raw speed is not.

You smooth, man!

The Folk Cycle

Day of the Month	I Chord (Root)	IV Chord	I Chord (Root)	V Chord
	CM7	FM7	CM7	G7
	BbM7	EbM7	BbM7	F7
	AbM7	DbM7	AbM7	Eb7
	GbM7	CbM7	GbM7	Db7
	EM7	AM7	EM7	B7
	DM7	GM7	DM7	A7
	——	——	——	——
	GM7	CM7	GM7	D7
	FM7	BbM7	FM7	C7
	EbM7	AbM7	EbM7	Bb7
	DbM7	GbM7	DbM7	Ab7
	BM7	EM7	BM7	F#7
	AM7	DM7	AM7	E7

The 'Day of the Month' Column

Once you can play this exercise, you may want to set up a schedule for daily warm up. Since we don't know whether your speed requires two weeks per line or one day per six lines, this has been left for you to pencil in as you wish.

Our First Sharp Chord — F#7

At last! A sharp chord!

We'd guess you know how to play the F#7 chord. Probably you've already guessed that you just play an F7, but slide all notes one half-step sharp (one fret sharp), toward the bridge.

Not too complicated.

Just Checking your Master Exercise ...

Just to make sure we've communicated OK, here is the first line from the Master Exercise part one all spelled out for Bass-Bottom Megatar.

First you arpeggiate (play note by note from bottom to the top and then back down again), the CM7 chord (which is the I-chord in key of C) and you do this several times.

Next you arpeggiate the FM7 chord (which is

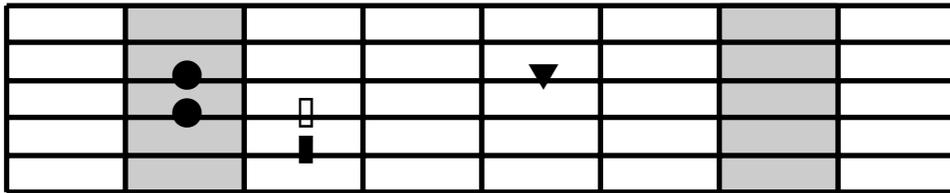

the IV-chord in the key of C) several times.

Then you arpeggiate the CM7 chord again several times.

Finally you arpeggiate the G7 chord (which is the V-chord in the key of C) several times.

How many times each chord? If you could do once per chord with no errors, that would be good practice. But the presence of errors would say try them twice each. Also there the presence of errors would say try them four times each. And so on.

Daily Warm-Up

The Six Noble Rhythms

Our recommendation is to use the Master Exercise as your Daily Warm-Up. As you will quickly see, the Master Exercise is a simple set of movements which accustom your fingers to being in the right place at the right time.

As you will also see, the Master Exercise leads directly to many ways of playing what we call 'Rhythm Bass' (basslines plus rhythmic chords), and it leads easily to walking bass, bass hooks, two-handed tumbling arpeggios, and bass or melody solos and more.

So a daily practice session might consist of:

- Master Exercise Warm-Up
- Playing Some Songs
- Other Study: (sight-reading, theory, ear-training, composition, etc.)

Using the Master Exercise as your Daily Warm-Up is easy. Initially, we recommend six rhythmic ways to play it. These variations both groove your fingers into the chord shape with your hands going together, and these variations also start the process of letting your two hands select out different parts so they sound as if they're playing independently.

These six hand rhythms can be used just as they are to play songs, and after they are comfortable to your fingers, you will find it natural to add rhythmic variation, which very quickly give you a wealth of ways to play.

What we call the Six Noble Rhythms are listed in compact fashion in this table —

The Six Noble Rhythms	
LH Arp (Left-Hand Arpeggiate)	RH Arp (Right-Hand Arpeggiate)
LH Arp	RH Roots
LH Roots	RH Roots
LH Roots	RH Arp
LH Roots	RH GT-Chords (Guide-Tones)
LH Arp	RH GT-Chords (Guide-Tones)

What We Do Now, Kemo-Sabe?

Here's what you do —

- Select a line from the 'Folk Cycle' for today's practice. This gives you four chords.
- The first rhythm is LH Arp / RH Arp, which means you play the first chord's chord-tones up and down one note per beat, perhaps up and down on this chord several times. Then the same on the second chord, the same on the third chord, same on the fourth chord, then repeat the four chords the same way. Go round several times till your hands feel comfortable, and your ears say the rhythm is solid and the notes sound clear. This is the most basic and most useful of all the exercises.
- The second rhythm is LH Arp / RH Roots, and this means you do your same chord-tones up and down with your left hand, but with your right hand, play only the chord's root. Play it on the beat, play it off the beat, play it rhythmically wherever you like, but keep it simple. If errors multiply, make it simpler.

- The third rhythm is LH Roots / RH Roots, and this means you play the progression by playing only the chords' roots in each hand. Important Note: You still play the root with the finger you were using on that note when you were arpeggiating it. Play the roots in any rhythmic manner that pleases you. If errors multiply, simplify. This rhythm may take less time to get it right than other rhythms.
- The fourth rhythm is LH Roots / RH Arp, so your right hand goes back to arpeggiating the chord-tones on the beat up and down, while your left hand plays only the roots. Left hand should probably initially only play on the beat.
- For the fifth and sixth rhythm, we must learn how to play 'Guide-Tone' Chords, and that is next ...

The Duality of Guide Tones

In Jim Grantham's excellent 'JazzMaster Workout' you will find a great description of 'Guide Tones.' The Guide Tones in a chord are just two notes. The notes are the 'third' and the 'seventh' of the chord.

If you want to play harmony in the simplest possible fashion, you play these two notes. They are *easy*, because they are tones your fingers are already playing. They are *safe*, because if the chord has modifications such as a flat five or an added ninth they will still fit and sound harmonious.

Finding Guide Tones is Easy

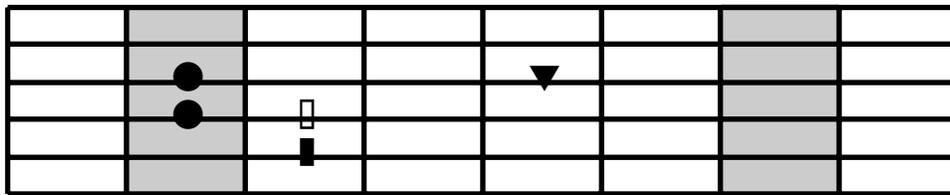

For each chord, you already know how to find the root because its finger-symbol is hollow.

In these major-seventh and seventh chords you are playing the root, third, fifth, and seventh, and therefore it's easy to find the guide tones because

- The *third* has got to be *the next chord-tone up from the root*, and
- The *seventh* has got to be *the next chord-tone below the root*.

Try picking out the guide tones on the chords below. Lightly pencil-circle them on the graph.

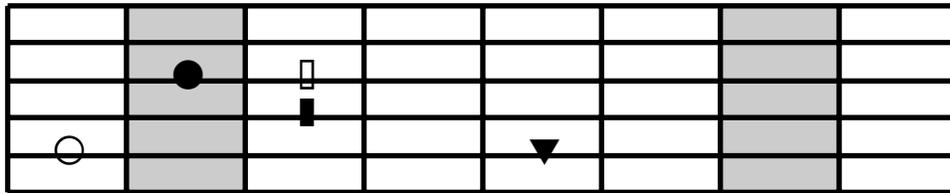

Bass-Bottom Megatar — Left-Hand CM7

Guide Tones Exposed!

We hope you did the exercise of finding the Guide Tones (the third above the root, and the seventh below the root) on the previous page.

And we hope you got them correctly.

Before we go on, let's make sure.

For comparison, we asked our panel of experts to circle the Guide Tones in the chords below. You got them correct? Then you're an expert, too!

But if you got any wrong, please figure out why and see why these circles show the third & seventh before you go on.

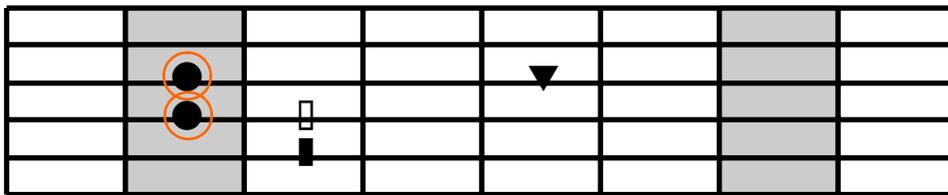

Noble Rhythms Numbers Five and Six

Now you can play the complete Warm-Up —

- The fifth rhythm is LH Roots / RH GT Chords, which means your left hand just plays roots on the beat, and your right hand plays the third and seventh together in any simple rhythmic fashion.
- The sixth rhythm is LH Arp / RH GT Chords, which means your left hand plays the chord up and down on the beat, and your right hand plays the third and seventh together in any simple rhythmic fashion you desire.

Yow! You got rhythm!

Fingering?

The Major-Seventh chords are especially kind in that strict fingering of the Guide Tones works out just fine. On a chord like FM7 you are using exactly the fingers on the third and seventh tones as you'd use when arpeggiating the chord.

On a chord like CM7 where the guide tones are two notes at the same fret on adjacent strings, you can still play both with the first finger as indicated — that is you just tap your first finger so it strikes

both strings.

Now it would be possible to use two fingers to fret the Guide Tones, and there would be some value in such a practice, because it would make possible playing the two guide tones either simultaneously or at different times.

Although that would be a useful thing, for now just play them in the simplest manner: simultaneously, using one finger to strike both strings.

Sour Seventh-Chord Guide Tones

Below are the complete set of Dominant Seven or simply Seven Chords from A to G.

Notice that when the third and seventh fall on adjacent strings, they always form a diagonal.

When two notes fall on the *same* fret on adjacent strings, then their vibrating harmonics tend to line up (as you can see using an oscilloscope) and they tend to sound coherent. Two such notes are 'a fourth' apart.

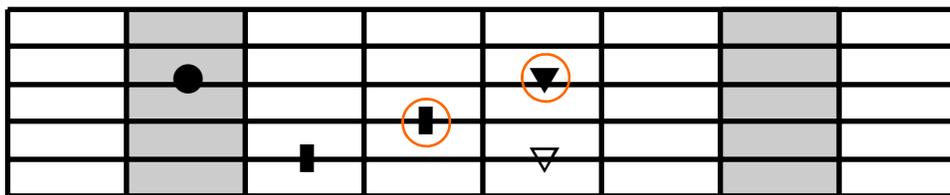

But when two fall on a diagonal as do the thirds

and sevenths shown on most of these chords, their harmonics tend to clash, and this is what gives your ear the typical 'sour' sound of the seventh chord. Such notes are 'a flat fifth' apart.

Note that this 'diagonal' comment does not apply to diagonals slanting in the other direction such as in the C7 chord the C-note and the E-note. These notes are 'a major third' apart, and their harmonics tend to line up in a way that's pleasing to our ear (but different from the 'fourth apart' sound).

How might you finger these Guide Tones?

Fingering the Seventh Chords

Fingering is not so obvious, is it? But there is a reasonable and orderly way to go about it, and we'll tell you right now something that almost works perfectly — Think of arpeggiating the chord and finger the first third-or-seventh you encounter just as in the arpeggiation. It will then be obvious which finger to use for the second Guide Tone.

However, on the B7 and E7 this big plan fails

because the first Guide Tone you encounter occupies your third finger. Although you could then use your 'spare third finger,' that is, your little finger, to play the other guide tone, we suggest that in this case use your second and third fingers, and there's only one way they'll easily play the two Guide Tones. It's obvious. It's easy. And it works OK, so that's what we'll do.

Get the Rest of Book One, and then Book Two ...

This 'PREVIEW VERSION' Ends Here!

In the full version, there's more, another 30+ pages, with information about minor seven chords, sample songs, blank charts for your use, song playing tips, and more!

You can buy the full Book One from our online custom shop at <http://www.megatar.com>, or from our [EBay Megatar Store](#).

... Or ... you can sign up for our free newsletter, and get the full version of Book One as a free bonus with your second newsletter. The newsletter has lessons, interviews, Tappy Tips, and news bites of interest to two-handed touch-style musicians ... and that's you!

You can sign up for the free newsletter at <http://www.megatar.com>. Why not sign up today?

What's Next on the Bookmark?

Book Two is named "Easy Touch-Style Rhythm" because the focus is on Rhythm.

Book Two will take the Bookmark System to a new level, and increase your ability to play basslines that are more than just roots.

Now roots are great, and it is amazing how many songs you can play using just roots and still sound perfectly supportive, perfectly rhythmic, and completely musical.

However, in Book Two we will introduce Seven Basic rhythms, to form the foundation for basslines for song after song after song.

Further, Book Two will introduce you to playing Triads (root, third, and fifth) in several rhythmic patterns so that you'll have more choices for playing songs.

In Book Two, you'll learn two new 'Cycles' or chord progressions. First you'll learn the 'Jazz Cycle' (also called the 'Two-Fives'). This simple progression occurs over and over and over again in so many songs.

This is where the minor chords come in, and you'll learn to weave those into your Master Exercise so that they're comfortable and familiar to your fingers.

You'll learn the 'Son of Jazz Cycle' the famous 'Popcorn Changes' or 'Ice-Cream Changes' which have been immortalized in Blue Moon, (I

Can't Help) Falling in Love with You, The Seine, I Like Peanut Butter, and perhaps ten thousand other songs.

With this expanded four-chord progression, you can warm up with the Master Exercise, spending only a few minutes daily on the Six Noble Rhythms, and yet you'll be cycling through all the most common chords, in the sequences in which they appear in song after song. You'll be cycling through all the "keys" at the same time. Easy!

To open the door to reading music, and to expand your rhythmic repertoire at the same time, we will introduce Standard Notation, which is the way that the world writes down music. In today's world, it's not wise to be illiterate, and for a musician, it's not wise to be musically illiterate. However, many musicians are put off by the seeming complexity of Standard Notation, and learning to read music. Yet when you can read, a *universe* of songs opens up before you.

And the truth is that it's not that difficult to learn to read (and write) music. Like the Bookmark System, it requires only breaking it down into reasonable parts and focusing on the basic building blocks that will prove most useful. In our case, we only need to study *rhythmic* notation. And you'll discover that it's pretty easy to learn.

With this background, you'll now find it easy to begin the jazz technique called Walking Bass, and between the Seven Basic Rhythms and Walking Bass, a world of basslines is possible.

Now that you have gained familiarity with the chords on which most western music is based, and now that you can play simple basslines, and now that you have a wider palette of rhythms from which to choose, you will be able to play a wide variety of songs. If you are diligent, you can play every one of them differently. That is to say, only *you* will know that you are playing them all using the same basic system. Your listeners will just think that you're a very good musician.

And, of course, you will be.

About Mobius Megatar

Mobius Megatar is an instrument manufacturer. Our company was created for the purpose of bringing more music and more ‘tappistry’ into the world.

‘Tappistry’, *noun*, the artistry of tapping on strings in order to make music, thus making simultaneous two-handed play possible on guitar-like instruments.

Who are we? We’re engineers and we’re musicians. We like music, and we like the two-handed touch-style method. And we think that lots of other musicians would like two-handed tapping, if only it were a little easier to play, a little more affordable, and a little better known.

So that’s given us our mission: Make a great tapping instrument, designed to be easy to play, designed to be affordable, and place it in musicians’ hands all around the world.

Mobius Products

Mobius Megatar manufactures a line of specialty tapping basses, along with special pickup arrays to customize the sound, and requisite accessories such as strings and cases and instructional material, of which this is the first book of a series.

You can find detailed information about our products on the web at <http://www.megatar.com>

Traktor’s Finger Symbols

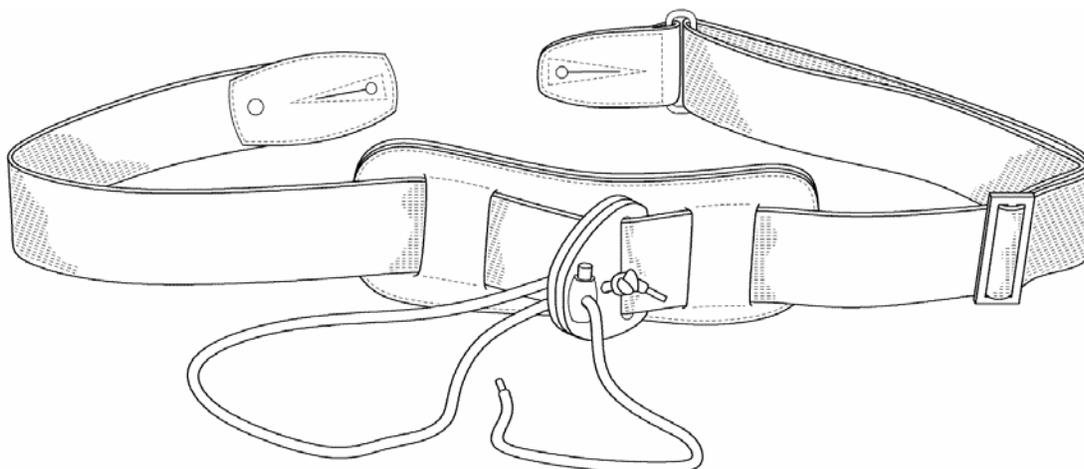

Graphs in this book were produced by superimposing an (invisible) table to contain the finger-symbols over another (visible but empty) table whose lines represent the strings and frets.

For the finger-symbols themselves we created a simple true-type font called TrakBats™ using Macromedia’s Fontographer program.

Then one simply types TrakBat symbols into the (invisible) table cells. The invisible table is offset slightly from the underlying visible table so that symbols automatically center themselves upon the ‘string’ line between two ‘fret’ lines. TrakBats are easy to use because the symbol for first finger is under your first finger on each hand as you type, the symbol for second finger beneath your second finger, etc. Using the shift-key makes the symbol hollow to show a chord or scale’s root.

Traktor’s Finger Symbols and the TrakBats font are available free of copyright restriction for anyone who wishes to use them. Find them at:

Our Purpose and Intent

The Mobius Megatar organization was created by a group of musicians, luthiers (guitar-makers), and engineers, for the purpose of bringing more music into the world.

Our plan to accomplish this embraces two activities:

- To promote and spread a new way of playing music, which is both simple and powerful, and which can be learned more quickly than methods of the past. This method is called the Easy Touch-Style method. This is Book One of that method.
- To design, manufacture, and provide specialty instruments designed to best support this powerful method of play. These instruments (“megatars”) are designed for ease of play, to provide superior tone, and to play more in-tune than conventional instruments.

For more information about Mobius Megatar, the Easy Touch-Style method, and our specialty touch-style instruments, please visit us online at <http://www.megatar.com>

This book is offered for the benefit of all sentient beings.
